Name	A.S.
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I am already perpetually exhausted and feel I never get quite enough sleep, rest, or recovery time from my obligations. Adding in the co-occurring physical health conditions exhausts me further. I have to push back on the idea that sensory challenges are some separate, co-occurring condition rather than something baked in to autism. Sensory challenges are just a part of autism, and those have to be mitigated with aids such as headphones/ear protection and sunglasses. Creating a world in which people are not so controlling of others that they balk at someone wearing headphones should be the ideal goal. I'm also concerned that scientists think they can or should make our sensory challenges go away because in the correct environment those can be an asset. It's just that none of us lives in the correct environment. Motor differences are interesting as not all autistic people have them. I certainly do and it would be nice to fall down less I suppose. Dyspraxia is the one piece of my autism I'd like to completely jettison. It's legitimately dangerous and I've had so many injuries over my lifetime that would not have happened if I didn't have motor challenges.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	These conditions for me have only ever occurred because of people systematically bullying, abusing, and ostracizing me just for being myself. They're all literal trauma responses, trauma of being abused. Being autistic is not inherently harmful and the autism phenotype has been found in prehistoric human remains. Something tells me it's a trait that can be useful. Some people are hunters and some are farmers, right? They're both important. Why are people so horribly abusive and awful and violent towards autistic people? I think that's the more important question to explore. Also, ADHD is a developmental disability, not a mental health condition. I don't understand why you lumped it into this question and then also included it in question 3. That seems really contradictory.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have ADHD and it's difficult to "do capitalism" very well. Traditional employment is hard for me. I can swing it okay, but I'm often extremely exhausted and feeling resentful that our world doesn't afford other ways to survive aside from having a job. I can't force myself to do anything immediately and it takes me a long time to get anything done. I get distracted and derailed by other "side quest" sort of tasks along the way.
What additional research is needed to help address co-occurring conditions for autistic people?	Just acknowledging it exists and making the distinction between co-occurring and something inherently part of autism is important for dispelling myths and information (like people thinking if someone stops eating gluten their autism will magically go away). Some people think autism and ADHD are the same thing, some people think they're two distinct conditions that can occur in one person at the same time. Also approaching research from a compassionate and humanistic space instead of treating us like your little lab monkeys and like we're just a "research subject" would be the bare minimum. Switch to respectful and affirming, non-pathologizing language for starters. Pay autistic people to participate in studies and pay them handsomely. Don't collect DNA samples because the human rights violations implication of doing that is enormous. Basically don't be unethical eugenicists and don't see researching us as instant dollar signs. We are human beings, treat us as such.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access	Actual equitable treatment. Supports that aren't conditional on us being perfect with being on time and filling out dozens of forms. Supports that don't restrict our lives or strip us of any autonomy whatsoever. I'm radical enough that I want this for all disabled people. Nobody should have their

<p>to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>right to make decisions about their lives stripped away from them just to receive help. For those whose disabilities make decisions challenging, I think guided decision making is an equitable and compassionate middle ground so the person still retains autonomy and gets to have a full range of human experiences. Basically disabled people are treated as subhuman and deprived of life experiences because it's thought that we "can't handle it" and that's just gross.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>So much. COVID has so many neurological side effects, so it's not just an upper respiratory disease. The number of people with long COVID being basically ignored by the CDC, NIH, and medical profession at large is no less than criminal. When you already have disabilities and co-occurring conditions, this just adds another layer of pain and exhaustion to your life. I mask to protect myself and vulnerable loved ones, and the social and political nonsense people have around wearing masks has prompted strangers to harrass me in public over simply trying to protect myself. Autistic people are already targeted and bullied, so this adds another thing that people bully me over.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Remote work was good for me because I could regulate myself in my own, quiet room at home and could work a flexible schedule and got a lot more done. Luckily I live in a household that was conducive to me getting things done at home. I didn't have to mask (camouflage autistic traits) for the benefit of everyone's little feelings at work. I do miss the concept of "third places" where you could just go hang out and "people watch" for awhile, just simply exist somewhere without having to pay lots of money to do so. The disappearance of third places has been slowly happening since suburbs were invented, but COVID accelerated their death. You can't even go to a park without there being hostile architecture, or you're lucky to even find a bench to sit on and watch the day go by. It's sad. But the elders want to yell at younger people for being "inside" all day, but there aren't any good and safe places for people to hang out outside, either.</p>

Name	Aaron
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My sensory issues make it harder for me to stay calm out in loud public spaces like clubs/bars without being overwhelmed. I have trouble falling asleep and staying asleep most nights between sensory issues and insomnia. I also have to be near a bathroom most times of the day in case my stomach issues flare up.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My mood swings drastically some days due to feelings of anxiety or depression. It's harder to work through the feelings I get and figuring out why I have them. When I get them they also hit hard. At work it causes me to have trouble focusing on my tasks, and at home I can become despondent with my partner. Even with medicine the ADHD and anxiety aspects I have to put in extra effort to overcome. It's exhausting, but in order to function in society I have to put in a lot of effort masking my symptoms.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have trouble communicating with my partner on occasion if we aren't directly blunt or specific about our topic. I have to ask extra questions and take a moment longer to think and process what is being communicated to me sometimes which can cause me to miss details. I tend to have to ask a lot of questions to make sure I'm doing something correctly, and will often repeat myself to make sure I get my point across.
What additional research is needed to help address co-occurring conditions for autistic people?	More research on undiagnosed adults would help. Just anything that can be found to make our lives easier or a better way to understand ourselves and our place in the world would help.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Making disability services more accessible to autistic people who are able to maintain a job. Just because we can, doesn't mean we aren't struggling daily with maintaining other aspects of our lives as well as masking our symptoms in order to stay employed. My disability is debilitating when I put all of my effort into masking at work or in public, and I get home unable to do chores or basic tasks to care for myself being burnt out.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Just being afraid of getting sick or getting someone else sick. I'm worried about the long term effects the virus has on the body and it adds another thing to be anxious about in my life.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Being able to stay home and not interact with anyone face to face was honestly one of the best things I ever experienced in my life. It's hard to always be social and sociable especially when working or in public, and the pandemic at least temporarily helped that aspect and allowed me to not be anxious about social interactions or masking all the time. I was finishing college and working remotely when it started. Since coming back to work and obligations in person again, I've noticed how drained I always am masking compared to when I was able to just do everything from the comfort of home and on my laptop.

Name	Abby Schindler, Institute on Disability and Human Development
Demographic	Autistic individual; Family member of an autistic individual; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges seem to be most significant in both children and adults with autism. While the school system is improving in providing sensory accommodations for children, it seems most adults don't know how to advocate for this in the workplace and/or are not allowed sensory accommodations in the workplace.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The co-occurrence of autism and ADHD seems to be a significant challenge, and the term "AuDHD" is frequently used by autistic advocates surrounding this phenomenon. The research doesn't tend to treat these as distinct separate disorders. I believe research and clinical practice could benefit from understanding ADHD and autism more fluidly, as intertwined aspects of neurodiversity. The numbers on suicidality among autistic people is alarming. Efforts to educate crisis line operators on autism would be helpful. Some sort of crisis line by and for neurodiverse people would be even more helpful. It seems many autistic people, who are already familiar with mental health systems, fear they will be involuntarily admitted to a facility if they reach out about their suicidality. Because of this, they don't seek out help when struggling with suicidal ideation. There should be more ways for autistic people to receive safe and anonymous help. Having the option to communicate through writing when seeking help might make more autistic people feel safe seeking help as well.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I am a verbal autistic adult, but recognize that many people with autism have communication disabilities that limit their lives significantly.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services and supports for late-diagnosed autistic adults which are covered by insurance plans.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	The reduction of social gatherings has made many people with autism regress in their social skills.

in-person social interactions and obligations)	
--	--

Name	Abi
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	It varies for each autistic person. Personally, my biggest challenges are all sense related. The world is loud, like my sound sensitivity has been turned up to eleven, but the sounds all get jumbled in my head so I often can't understand spoken words. I also can't tell the direction sounds are coming from.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The hardest thing I've had to deal with would be self harming behaviors and suicidal thoughts. I still feel like those were largely my own fault. If I hadn't been so focused on being normal, I might have never done that. Other than that, ADHD has been troublesome because I can't perceive the passage of time. This makes academics difficult even when the subject matter is easy.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I don't understand tone of voice very well and I can't read between the lines. I'm very gullible and I take things at face value. People have taken advantage of this before. People have gotten angry at me for this. I get looked down upon for asking clarifying questions, but when I don't ask them I don't do things exactly how they were intended to be done. It's like everyone else is a mind reader and I'm just doing my best to keep up. I've also offended people by talking to them the way I am talked to. I mimic the way I am spoken to during conversation and I have been told that I sound incredibly condescending when I'm trying to be comforting.
What additional research is needed to help address co-occurring conditions for autistic people?	I think our development needs to be researched more. There is something different about the way we develop that causes these co-occurring conditions.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance for sensory needs would be huge. I am fortunate enough to afford high quality headphones that don't press on my skull and even play music so I can regulate my emotions. But there are a lot of people in America who can't even afford adequate food. Additionally, education for parents and children would help so many autistic people grow up without the same alienation issues I struggled with. My parents were always worried that my brother and I would be bullied by other kids who didn't know about autism. I have a very vivid memory of my brother being scolded for flapping his hands. I tried to be a chameleon when I was younger. To this day it is my deepest regret.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	I really struggled with school due to the lack of structure. However, my depression actually got better during the pandemic. The overstimulation of a classroom caused me a lot of distress, and social distancing allowed my brain to get a proper break.

in-person social interactions and obligations)

Name	Abi Lea
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	A lot of autistic people have mobility issues caused by co-occurring conditions like dyspraxia and connective tissue disorders like HEDS (Hyper-mobile Ehlers Danlos Syndrome) and HSD (Hyper-mobile Spectrum Disorder). This can cause significant challenges, such as difficulties driving or obtaining a drivers license and difficulties maintaining employment. For me personally, poor co-ordination and spatial awareness has meant that I have never been able to drive. Joint pain and mobility issues caused by connective tissue disorders can make working very difficult, painful or impossible for some autistic people. Sleep disturbances like insomnia, vivid nightmares, having Delayed Phase Sleep Syndrome, and sleep apnea, can seriously impact our quality of sleep and make it more difficult to participate in and handle the activities and stressors of everyday life. This can in turn impact our ability to work, complete daily care tasks and lower our overall quality of life.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	OCD causes me a significant amount of added stress as an autistic person, and can make it more difficult for me to participate in every activities. For example, I often get repetitive intrusive thoughts about jumping in front of the train and so this makes traveling by train much more difficult and the stress has a big impact on my mental health. ADHD compounds my difficulties with executive dysfunction making completing daily self care tasks, organizing my life and doing executive tasks like paperwork much more challenging. ADHD also makes it a lot more difficult for me to regulate my emotions and emotional responses. This makes me more likely to have meltdowns in public that can effect my employability and relationships with peers. I have gone through periods of depression and suicidality, as well as experiencing constant high anxiety, due to being overwhelmed by many aspects of life and feeling that not being alive would be the most peaceful option. It is depressing and demoralizing to feel like you are always battling upstream, in every aspect of your life. Everything (looking after myself, working, traveling, housework, socializing etc) is more difficult, overwhelming and exhausting for me than for my peers and this has a negative impact on my mental health.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Dyspraxia has made it very difficult for me to learn how to drive, and as a result I cannot drive and do not have a drivers license. Some of the challenges experienced by other autistic people with co-occurring disabilities, especially those with high support needs, include: not having access to AAC devices and therefore not being able effectively to communicate with others. Other people assuming incompetence because of their multiple diagnoses and therefore not providing them with access to the same educational recourses or activities as their peers.
What additional research is needed to help address co-occurring conditions for autistic people?	More research into HEDS and HSD, there is very little research on these conditions and therefore very little therapies or treatments available. More research into mental health conditions and how they impact autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More financial aid to help autistic people who cannot work because of co-occurring conditions, better insurance coverage to help access the medical care that autistic people need. More access to neuro affirming therapy for autistic adults.
What lasting impact has COVID-19 infection and illness had on co-	A lot of autistic people who were already impacted by auto-immune diseases and connective tissue disorders, have had increased struggles with their

<p>occurring physical and/or mental health conditions for autistic people?</p>	<p>physical health because of the impacts of COVID-19. Long COVID can cause muscle and joint pain as well as a compromised immune system- issues a lot of autistic people already face due to co-occurring physical conditions. Many autistic people also with executive function and focus because of co-occurring ADHD, and COVID has been reported to cause brain fog and executive function, which can therefore exacerbate these struggles. This causes even bigger obstacles to stable employment, ability to perform self care tasks, and overall good quality of life for autistic people.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Some societal changes because of COVID-19 have had a positive impact on the autistic community. Events, services and therapies being held online often makes these things more accessible for many of us. Working from home is also a great benefit for many autistic people who find working at the office taxing due to things like sensory issues and social challenges. However the change caused by the pandemic has been also created issues for many autistic people due to an increase in feeling socially isolated and difficulties processing and handling change.</p>

Name	abirami duraiswamy
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	There is lack of interdisciplinary study of neurodevelopmental disabilities (NDD). There are studies of higher lead level in autistic individuals, but yet, there is no mandatory lead tests, no interventions. Most people on the spectrum have low skeletal muscle mass and there are studies correlating poor skeletal muscle mass and executive functioning, which most autistic individuals struggle with. Poor muscle mass also leads to other health problems and physical disability. Most children on the spectrum are sensitive to certain food groups and are likely to have nutritional deficiency and gut issues. However mainstream medical community does not address this. Same with sleep issues. Studies point that individuals with NDD have sleep issues including sleep apnea. There is not cultural competent interventions to ethnic minorities. Most families struggle to access services. Waitlist for diagnosis is almost a year long, and same for most of the services. Most individuals with NDD and their families struggle with poor mental health, mostly due to lack of support.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son has zero social life. Aggression, anxiety are the two most common issues. There is no awareness about sexual development and needs for the NDD population. Accessing mental health care is difficult for this population. There are hardly any mental health providers trained to work with profound autism and intellectual disability.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Life skills training is very poor and many adults with NDD are restricted to live at home.
What additional research is needed to help address co-occurring conditions for autistic people?	Since the diagnosis of autism is increasing every year, we have to find the cause and also identify parents/mothers who are at risk. We also need cultural competent interventions. The behavioral interventions rarely help and are very difficult to access. Policies to help promote mother, parents and family functionality is the key to improve outcomes for the NDD individuals.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The gap between research and practice is atleast 10 years long. We have to bridge this gap. Maternal health care is important, and should include pre-conception, pre-natal and post-pregnancy.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 has affected the NDD individuals and their families much more than the general population. Most programs for the NDD community are still impacted with long waitlists. More children are diagnosed with behavioral issues than pre-COVID-19
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Positive - As a parent I have come to accept that my son is better off in a small social circle than in the community. Negative - I lost trust in the system, in the government and policymakers.

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Adam
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	It is harder to keep a schedule because of my sleep issues. early mornings I have lots of energy but by mid day I am drained and can not keep up with social demands, My sensory system gets overwhelmed easily it affects the type of food I can eat to the fact I can't swallow pills , I have to have soft things to keep me calm, and I can't handle large crowds.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety: keeps me from driving, work it makes it hard I have always been harassed for being different then others so large crowds are a no go for me, Suicidal; no I do not want to kill my self but I do feel like life would be easier if I was not here, it is deferent then wanting to kill oneself, I try is a desire to have never existed
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning: for me in K-12 and in college, the harder part for me to all of it was the pace and the memorization they did not give me ample time to learn it, and digest it. Trying to memorize things just to pass a test for me and the other people I knew that are autistic. Just does not work. Communication: communication is very hard. I do great on a one on one basis, put me in a group chat with three or more people and I freeze because I don't know the proper way to react or the proper way to engage in conversations:
What additional research is needed to help address co-occurring conditions for autistic people?	we need to start by studying females and and continue the studying into adults. A lot of research and effort is put in the children. I grew up in a family that did not believe in mental illness so I was not able to seek help until late in my 20s and it was extremely difficult to find. a lot of the therapist that I have tried to see for the research I've done are uneducated on the subject.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	it is very difficult for me dealing with people that are supposed to be professionals when they do not understand traits of autistic people it would be helpful if there was some sort of training that you guys could do specially around Social Security departments about autism and how to talk to them and ask them questions appropriately. I tried to apply for disability a few years ago and was unsuccessful. At that point in time I had not been legally diagnosed with autism. I am in the middle of going through the process right now and it is very difficult. I am locked out of my online. I went into the office and explained that I need help and they just keep telling me to do it online. They do not truly understand the struggles that come with autism .
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	One of the nice positive things from Covid was when I had to go into public. There was way less people, so I greatly enjoyed that, the other part that was very beneficial, and I hope it stays is the ability to go to my doctors and therapist, online and virtually that helps with the anxiety of driving And appointments . The other thing that was very beneficial for me and I feel for a lot of people with the ability to work from home I had my cat and my sensory been available when I got overwhelmed
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Adam Wehn
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, my depression is not caused by any clinical(chemical imbalance) source I have come to realize. The primary source of my depression has been infantilization, refusal to accept or understand my needs, and dismissing or downplaying my stated needs or struggles with meeting the expectations that societal pressure places upon me. Such as the societal expectation that I live in my own apartment and manage my own finances(one of my biggest struggles) with no other housemates(or community mates) leaving me feeling isolated and unwanted.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication difficulties, for me I am best able to communicate my feelings and needs in writing. But it has been a struggle to get so many people or organizations to allow me to interact/interface with myself through written communications such as email. With a healthcare provider I had to reach out to their umbrella healthcare group disability resources customer service section to get them to stop calling me, which is something that while I can do it speaking over the phone is very nerve wracking for me and induces anxiety and stress.
What additional research is needed to help address co-occurring conditions for autistic people?	I don't feel additional research is needed, what I do feel is needed is more support options being made available to the neurodivergent community. Especially in the form of housing options of a communal nature, either small communities where each individual has their own living space with a communal space for them to choose to socialize with others. Or a home setting where each individual has their own space to sleep in and retreat to if the stimulation of the world becomes too much for them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I have previously stated prior but more support systems that do not apply additional pressure on individuals to conform to societal expectations.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	

in-person social interactions and obligations)

Name	Adriene Fern
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastro issues interfere with work consistency impacting performance reviews
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The anxiety in the world at large creates repetitive behaviors, may require prescription medication and service animal to be able to effectively manage and maintain mood
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Your panel asks how autism services could be improved to better address co-occurring conditions in this population. It must include changes and training to the social security phone and direct customer support staff. Social Security's inability to efficiently process and assist their most vulnerable consumers with consistent and knowledgeable information is deplorable. The maze of paperwork and lack of county/state sharing information creates a maze of misinformation, leaving many without funds. In April 2023, I contacted Congressman Jared Moskowitz's office for HELP! My son with autism had his benefits rescinded in February 2023. With his office's intervention, he was reinstated in July 2023. What will it take for the Social Security Administration to be able to talk to the other sub-departments of Social Security? We live in the 21st century with computers, email, and advanced technology, yet Social Security cannot streamline from one department to another. How many requests did your office and colleagues have to interfere with on behalf of your constituent's Social Security matters? Reform is required; we must do better for our most vulnerable. A broken system is no longer acceptable. Thank you for your consideration in this critical matter.

Name	Adrienne Benjamin , Parent/Gaurdian
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disorder: My daughter has Level 3 Autism, she is currently 27 yrs old, totally non-verbal. For most of her life she has had a severe sleep disorder, waking up after an hour like it's morning, or not falling asleep till 2am. She is currently on a lot of medication to help her sleep. Ambien, Estazolam and Melatonin. Irritable Bowel Syndrome: Terrible episodes of diarrhea for years. Allergy testing revealed lactose intolerance. Changes made did not solve IBS. Currently on Viberzi which helps. Self Injurious Behaviors: Hand biting, hitting her head when frustrated, or annoyed. Obviously related to her non-verbal autism.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For parent caregivers: Sleep Disorder meant chronically poor sleep for parents, and my child. IBS: Significant hygiene challenges dealing with chronic diarrhea, as well as discomfort in my child. Difficulty planning activities out of the house. SIB's and Aggression: Episodes of SIB and aggression cause both pain and chaos, broken furniture, wounds to my daughter. Home doesn't feel safe. My other child also had to be hyper vigilant about my daughter's SIB;s and violent outbursts.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Intellectual disability plus autism creates a situation of chronic difficulties for my child. Developmentally, she remains a 2-3 yr old. She will always need 24/7 care, cannot be left alone, needs help with all aspects of personal hygiene. Level 3 Autism is present in approximately 25-35% of those with Autism. Once these kids age out of school (22yrs), there are no mandated services. Nor are there many agencies that have staff trained to work with people on the severe end of the spectrum. Parents dont live forever. Most agencies are desperately understaffed (primarily because of low pay).
What additional research is needed to help address co-occurring conditions for autistic people?	Great question. First, there still is no answer to explain why there has been and still is a massive increase in the number of children with Autism over the last 25 yr or so. That's important. Very important to study. And, usually, people with severe types of Autism are excluded from research. Yet, it is those with Level 3 Autism who seem to have the most co-occurring conditions. Research that too.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More funding for programs, higher wages for DSP's (Direct Support Professionals). More training for DSP's to improve services as well as to create a career path for DSP's. More training to the medical and dental providers so that they can effectively treat our population. More housing options, so people have a whole range of choices to meet their needs. Including congregate communities.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	

in-person social interactions and obligations)	
--	--

Name	Advocates of Autism of Massachusetts
Demographic	Representative of advocacy organization
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>This comment is submitted by Advocates of Autism of Massachusetts, a state-wide grassroots association of self-advocates, families, service providers, and concerned citizens advocating on behalf of autistic people in our state. Many people with autism face a diminished quality of life on a daily basis due to co-occurring health conditions. The impact of certain co-occurring conditions can even result in premature death (e.g., catatonia, epilepsy and seizures). Moreover, due to communication difficulties and other manifestations of autism in an individual, these conditions can be challenging to diagnose and treat, leading to chronic discomfort and pain and a worsening of the co-occurring conditions. Medical conditions are not always observable, and many individuals on the spectrum cannot describe their discomfort or pain with any specificity. Due to sensory challenges, many devices and tools used for diagnosis and treatment may be unavailable (e.g., inability to tolerate attachment of leads to complete an EEG in connection with seizures). Oftentimes, the symptoms of co-occurring conditions are dismissed as “just part of autism” and go untreated, are treated with inappropriate behavioral interventions, and may worsen and lead to further complications.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Higher rates of co-occurring mental health conditions among people with autism (including various types of anxiety, obsessive compulsive disorder, depression, aggressive or self-injurious behavior, and suicidality) are well documented and create significant challenges including impairment of sleep and appetite, irritability, repetitive movements, insistence on sameness, isolation, severe meltdowns, and self-harming behavior. These challenges in turn contribute to and cause spiraling of further mental health pathologies and behavioral issues, as well as physical health challenges, and may severely degrade well being and become life-threatening. Pica and elopement, experienced by some in the autism population, are extremely serious and dangerous, as are aggressive and self-injurious behaviors which result from both autism and co-occurring mental health conditions. These conditions frequently lead to bruising, lacerations, scarring, broken bones, ripping out of hair, skin infections, detached retinas, and concussion. In many cases involving aggressions, the person’s caregivers sustain these injuries. Obviously such injuries can be lethal and short of that frequently require emergency medical treatments, surgeries, and hospitalization.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>This question is confusing as it is difficult to separate these “co-occurring conditions” from autism, which is a developmental disability and in many on the spectrum is characterized by cognitive challenges and communication and learning disabilities. Depending on the severity of a person’s autism, their ability to live independently and engage in meaningful employment is significantly challenged. It is hard to designate certain challenges as more or less significant when one has a pervasive disorder that affects all aspects of one’s life and relations to other human beings and the environment.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Notwithstanding research into the causes and characteristics of autism over the past several decades, investigations of the manifestations of autism, co-occurring conditions and effective interventions has barely begun. This research is particularly limited for those with profound or severe autism. Much of the research undertaken to date excludes participants who are nonverbal or those who cannot tolerate the conditions, procedures and environments involved in the studies. An important focus of research going forward should be on better understanding and addressing severe behaviors</p>

	<p>such as aggression, self-injury, pica, and elopement, and identifying more effective treatments (medical and behavioral). Much more research is needed on psychiatric medications and other therapies. Given the characteristics of autism in many people (sensory issues, communication challenges, etc), research is necessary to develop technologies, instruments, and techniques to allow people with autism to better access primary care and preventative screenings, as well improve the diagnosis and treatment of chronic and serious co-occurring conditions.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Private and public insurance for children and adults should cover medically necessary treatment of autism, including treatment for behavioral conditions (e.g., aggression and self-injury); such treatments must be recognized as medically necessary under mental health parity. The number of physicians and other healthcare providers who are experienced in delivering primary and specialty care to children and adults with autism must expand to meet the needs of this ever growing population. There should be greater coordination among state agencies that fund and oversee the delivery of healthcare and long term services and supports so that co-occurring mental health concerns, in particular, can be addressed in a less difficult and more coordinated fashion. The Medicare system (not just the Medicaid system) must become familiar with and adapt to serve this growing population as the large numbers of children with autism born in the past few decades become adults and they become eligible for Medicare themselves or through their parents' eligibility. Collectively, we must develop technologies, instruments, and techniques to allow people with autism to better access primary care and preventative screenings, as well improve the diagnosis and treatment of chronic and serious co-occurring conditions.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>We are not in a position to comment on this and are not aware of research on the lasting impacts of COVID-19 infection and illness on such co-occurring conditions.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>COVID has had a devastating health impact. Reduction of workforce and number of viable LTSS providers, exacerbated by the pandemic, continues to date. Many autistic adults have yet to return to services, particularly those with severe behavioral or medical challenges with more intensive staffing and those transitioning from education to adult services during and after COVID. (The vacancy rate in direct care positions in MA in Oct. 2023 averaged 24% (Association of Developmental Disabilities Providers survey).) Reduction in services has increased isolation, loneliness, skill regression, lack of exercise, and lessened overall well-being. After COVID closed in-person gatherings, some autistic people became anxious to leave their homes - even for school - due to social anxiety or fear of germs, leading to worsening mental and physical health. One positive outcome of the pandemic: an increase in telehealth services which can be a real advantage for some with autism. Some telehealth flexibilities have since ended, however, e.g., no more billing for remote CBDS services. There are circumstances when this would be beneficial to ensure continuity of care. e.g., when a participant is not in person for medical reasons, but still could participate in some activities. Also, some individuals are more comfortable participating in certain services online versus in-person. Eliminating such flexibilities fails to recognize that online communities are a new reality and provide benefits.</p>

Name	Aidan
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have intense bodily pain and joint problems from the co occurrence of hEDS. I struggle to be able to work not from home because of this. My gastrointestinal issues make it difficult to live my life and little my diet beyond the sensory issues autism causes.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have anxiety, depression, PTSD, anger issues, and ADHD. All of these made it extremely difficult to thrive to school, and continue to make it difficult to work and have social relationships. I have to fight my own brain every day for the bare minimum of not simple curling up and dying.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I struggle to express myself verbally and am significantly behind socially.
What additional research is needed to help address co-occurring conditions for autistic people?	More research needs to be done in the effects of autism on women, people of color, various socioeconomic classes, and lgbtq+ individuals, as the majority of research and the most commonly used diagnostic tools were only tested on cisgender, white men and boys. New diagnosis tools would be amazing. It would also be useful to find the best ways for parents to raise children with autism without causing additional trauma and mental health disorders simply through not having the knowledge.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All insurance should cover therapy, simply put, but accessibility is also a big issue. Public knowledge of co-occurring conditions is next to non-existent, and many providers brush off concerns of these issues.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	We were able to see the benefits of work from home and how much better that was for us, but that option has been taken from many people, and the same goes for telehealth. I personally found quarantine to be a healing experience., with less physical and mental pain and overstimulation. I was able to get good grades, thrive in my job, and maintain friendships all virtually much better than I did in person.

Name	Aimee Doyle, Autism Mom/Disability Attorney
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	One of the most significant challenges is recognizing that these co-morbidities are common with autistic individuals - and that these co-morbidities affect both health and the quality of life. Research on how to treat co-morbidities has been sparse. Here is a list of co-morbidities that I have observed after 30 years in the autism trenches. 1. Gastro-intestinal Issues. A sizeable percentage of individuals with autism have issues related to eating, digesting, and eliminating food. For eating, this can include everything from severe allergies to foods, to extremely restricted diets (malnutrition), to pica (eating non-food objects and needing surgery to remove them). I've seen problems with explosive diarrhea, fecal smearing, and constipation. 2. Epilepsy and Seizures. One key point is that seizures affect approximately a third of autistic individuals - and seizures are rarely perfectly controlled. 3. Sleep problems. 4. Hypo-Hyper sensory sensitivity. Many individuals with autism have difficulty with sensory overload due to inability to handle light, sound, or texture. Others have "hypo" systems - like my son, who didn't feel pain.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son has experienced severe anxiety which compromised his ability to learn. He resisted all efforts at learning life skills. He had, self-injurious behaviors - in adolescence, he hit his leg so many times the hair fell off, and he walked on his knees until one knee became horribly inflamed. At times he has been aggressive (hitting others, punching me and my husband, poking me in the breasts). From my reading, I know that anxiety, depression, self-injury, and aggression affect a sizeable percentage of individuals with autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Approximately a third of individuals with autism are non-verbal, or semi-verbal, and cannot communicate effectively with even the best augmentative communication technology available. Approximately a third of individuals with autism (not necessarily the same third) are intellectually disabled.
What additional research is needed to help address co-occurring conditions for autistic people?	We need additional research on the co-morbidities that affect individuals with autism - both the physical co-morbidities and the mental co-morbidities. I think there should also be research into what causes they co-morbidities, and what causes autism, since it is always easier to treat something if one knows what causes it.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance could and should cover more autism treatment. We have spent hundreds of thousands of dollars on both conventional and alternative therapies for my son, without that much in the way of results. We have tried EVERYTHING. And almost none of it was covered by insurance. Insurance companies rarely cover even standard helpful therapies like speech therapy or occupational therapy and never cover newer therapies like biomedical intervention, sensory-integration therapy, vision therapy, or auditory integration therapy. There really hasn't been a new, effective treatment or therapy for over 15 years. And there is very little research on effective treatment for those who suffer from severe autism. There is little research on effective treatment for the co-morbidities of autism. Doctors don't seem to want to deal with either autism, or the co-morbidities.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I know individuals who responded poorly to the Covid-19 vaccinations. In some, it seemed to worsen their immune capacity. The vaccinations certainly didn't prevent infection, re-infection, or transmission.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Service disruptions in day programming were terrible due to Covid. Many people with severe autism just sat at home. Most were not able to work with any on-line services. Negative behaviors increased due to the lack of routine. Family members had to "pick up the slack." I know people who dropped out of the workforce or retired because they had to be there for a disabled child or adult.</p>
---	--

Name	Aimee Mingone, Teacher
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	All of these and I didn't know they were related. Sensory issues are probably the worst.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and ADHD. I used to really struggle with depression and suicidal ideation, but that nearly non-existent since my diagnosis. This helped me escape a lot of unhealthy situations too.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Auditory processing and executive functioning
What additional research is needed to help address co-occurring conditions for autistic people?	More public acknowledgement of autistic voices
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for diagnosis, autism support animals for adults, and workplace acceptance of accommodations.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I never had COVID
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Weirdly, the resulting cost and scarcity of safe foods for my digestive issues. I can't even afford most of what I can still even find since COVID.

Name	Akash Dey, ASD level 1
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges. Ringing in the ears from hearing multiple frequencies affects concentration and wears you out. It is like you using energy when you are doing nothing. This is especially bad when multiple noises overlap or you need to concentrate on multiple things. It can affect your sleep as well. I have sleep apnea, but in addition to that the ringing from a previous over stimulation can affect my sleep and as a result the next day I could be more tired. It is very frustrating that when I am off of work I still have to expend energy from being constantly overloaded during driving or doing tasks I cannot control.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety. For me my autism manifests as anxiety. I make impulsive decisions when my head is overloaded by sensitivity because I just want the noise to stop. It is too difficult to think on top of dealing with all that is going on. Most times I do it but there is no time without a challenge. During driving my autism manifests as anxiety. The headlights on the road, the noises from the car, focusing on small details. Anxiety is also caused from introducing new tasks or changing routine.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have difficulty visualizing things that are not definite. I failed college because I was struggling with communication and reading comprehension. I now know I can understand and trust numbers more.
What additional research is needed to help address co-occurring conditions for autistic people?	I think a study where you have adults with autism who have jobs write a daily or weekly report in their schedule and challenges they faced regularly as to when changes happened would be good. As well as how well their coworkers and workplace understood and supported them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I got diagnosed as an adult and it was extremely hard. It was a battle. I hope adults can have easier access to being diagnosed and covered by insurance. Kaiser in San Jose said they do not diagnose adults with autism and only have group therapy services for anxiety and depression. I think there is a huge lack of services for adults with autism. I had to pay out of pocket and get a diagnosis as well as help.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I got some heart problems after covid, I think it increases anxiety.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think the introduction of remote work and school are of great benefit. I never thought I could go back to school due to being forced into a crowded classroom with multiple noises going on and trying to focus. I am learning programming on my own in a nice quiet environment I can control. Having a hybrid schedule really helps me rest from sensory overload.

Name	Alan Owen
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues. Many meltdowns and difficulties with work are caused by sensory issues, and they exacerbate social difficulties, making it harder to interact with others
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Suicidality, depression, and anxiety can be explained somewhat by interactions with other people. When somebody is constantly told that they are acting weird, or strange, and are ostracized, then depression and suicidality are an expected result, and anxiety can come from interacting with those same people.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I personally only have issues with communication, so I can't comment on the others. That said, communication can be difficult sometimes, especially when social anxiety is playing a part. Not having my voice be heard because I'm not making enough sense to the listener is probably the biggest challenge I face.
What additional research is needed to help address co-occurring conditions for autistic people?	More studies of autistic brains in detail. One study I saw showed that the amygdala is enlarged in infancy in autistic people, and that it could be responsible for increased sensory issues and emotional dysregulation. This information, combined with the negative effect of cortisol on the hippocampus, led me to realize that interacting with people damages my brain. This was information that I myself had to piece together. Research showing the why of autistic issues, explained in a neuroscientific way, would do wonders.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Some ability to ensure security would be a good start. I'm thinking about universal basic income, which would allow autistic people to try out different areas of employment, and to find a place that works with them. Were I to not fall into a position where I could resign from my job safely, I would have committed suicide within the next year due to my co-occurring conditions. This position was living with my brother, who doesn't charge me any bills. Now, I can focus on trying to find a job that works with me, that I feel comfortable in. Before now, I had to work to survive, and my job was what was causing the problems.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	For those with social anxiety, the lockdowns were a blessing. Remote work and schooling were a benefit as well, and not worrying about social responsibilities was also good.

in-person social interactions and obligations)	
--	--

Name	Alessandra Stark
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disorders, eating disorders, sensory processing disorders, OCD
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, self injury behaviors, ADHD/ADD, low self esteem
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Behavior disturbances, communication delays, limited functioning, lack of understanding social cues, lack of environmental awareness, lack of self awareness, sensory processing disorder
What additional research is needed to help address co-occurring conditions for autistic people?	Additional research is needed on how to better treat anxiety when it comes to potty training and other tasks that are related to hygiene. Also there needs to be additional research on how to treat different eating disorders and sensory processing disorders that are involved in this
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, free and equitable access to services, more services in low income and rural areas, more communication between patient and provider, mandatory consent procedures before implementation, more schools receiving funding for ABA services/other services in schools (especially schools in low income areas), more funding for ABA centers and agencies (BCBA's have to pay out of pocket for materials and that should not be the case, this should be funded by the ABA agency but agencies cannot afford it, therefore there needs to be more funding), free and affordable access through insurance to environmental modification at home, schools, center, etc for safety reasons and needs of that individual
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It's greatly impacted children's attention span to task and activities that are not related to screen time. Also lack of socialization with peers has impacted children to not socializing as much losing those skills and unable to communicate effectively and endgame with their environment.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	It has negatively impacted their development for socialization, environmental awareness, sensory input, and generalization of skills across different environments and people. Things have gotten a little better now but people with autism continue to struggle more than ever before on these important skills because the lack of interactions and going to different places was cut during covid. Some of the most detrimental years of development were cut for children that impacts their development.

Name	Alex
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances which cause emotional disturbances, sensory over load, gastrointestinal disorders, heightened sense of touch, Ehlers danlos syndrome, hyper mobility, hypothyroidism, struggle with allergies to the point of avoiding vaccines due to allergies.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, adhd, self harm as a form of sensory overload management, low patience, low tolerance of sound
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Intellectual disorders that cause us to process things faster, however people don't appreciate that we process things faster so they fire us from jobs. Communication struggles. Learning disabilities due to lack of leeway in the standard school system
What additional research is needed to help address co-occurring conditions for autistic people?	Research on the impact lack of sleep has on an autistic individuals daily life.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More leeway when it comes to the standard work schedule. An autistic person has to use 2-3x the amount of energy as a neurotypical person for the same job. We are managing our our senses while as someone without autism doesn't have to manage that at all, nor put any brain power towards it. Insurance coverage for things to help an autistic person. Medication research to lower the sense would be phenomenal to the autistic community and individuals.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The Covid 19 vaccine, specifically Pfizer vaccine has given me an allergy that is unavoidable, propylene glycol, which is in everything down to city water and has made living my life nearly impossible without n allergic reaction, which makes attendance at work difficult, and then in turn makes keeping a job more difficult than it already is for an autistic individual.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive, less people approach us. Which creates less of an overload on us. Negative, people are more likely to reject each other which is something we already struggle with and it makes it harder on us to ask for help and get the help we need, even if it's just asking where something is in a grocery store.

Name	Alex
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges are receiving care insurance forces doctors to listen so little they dismiss or refuse to test or treat these conditions confusing pattern recognition ans years of research for trend following. Having these symptoms untreated also leads to an inability to work or an inability to work without being discriminated against. Only 15% of diagnosed autistic adults carry on successful stable careers while most are unemployed and chronically l'll despite having the ability to be incredibly diligent and overworking employees.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The issue here is the same as untreated physical illness, increased unemployment, increased discrimination in both the medical field and the job field. Untreated, mistreated or under-treated care also leads to a shorter lifespan with the average lifespan in autistic adults being drastically lower which can itself increase depression and feeling unwanted by society as it reflects society as a whole viewing us as expendable and disposable simply for communicating differently.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	More Autism run studies. A recent study at Harvard found Autistic people especially those with high pattern recognition are more accurately diagnosing themselves than doctors. This comes from a fundamental misunderstanding of the neurodivergency that textbooks and studies are overlooking based on outdated information from dangerous medical ideals similar to ABA or Conversion therapy. Research also needs to focus more on how socialization affects those with autism as it prevents vastly different in feminine raised people who as a whole are almost always late diagnosed if they get a diagnosis because the diagnostics are based on young boys only.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better protections from workplace discrimination, too many symptoms of Autism are considered acceptable reasons to harass or fire someone. More aide services, something as simple as a care coordinator who actually shows up had changed my life. Having access to Autism friendly instructions on paperwork as many government forms are vague and confusing for someone who needs direct instruction. Easier or permanent accesses to things like Medicaid with an increased risk of medical and mental co-morbidities many autistic people have to choose between neglecting their health and having shelter or food especially when working many days in a row or many hours can take our entire energy reserves leave us to pick between working or caring for ourselves. Overall accesses to UBI or Medicaid or assistance in having basic needs met would help autistic people flourish and be able to participate more in the economy and bolster the workforce in a way that would greatly benefit our own health as well as the US
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to	Having an increased option for work from home where I can control sensory overload and reduce burnout has been greatly beneficial the same goes for

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

higher access to delivery and telehealth appointments. The ability to move about with people distancing and masking has also greatly reduced the burnout I'd experience before the pandemic making it easier to retain a home and a job. I'd love to see these things grow and continue so that when there is space for it more people can enjoy more 3rd places more often without causing total shutdowns due to being repeatedly sick or overwhelmed

Name	Alex
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	In my particular case, sound and (non-epileptic) light sensitivity are on the severe side, causing pain like stabbing needles in my brain, eyes, and ears. Base from heavy machinery and loud music can cause crippling discomfort, even in my own home without significant recourse. I can wear earplugs and sunglasses when I can reasonably predict it, but i cannot wear both all day every day.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The whole of society is built in a way that shames and alienates autistic people. Much of the mental health issues stem from that simple truth. People intrinsically know that something is wrong with me and with that gut feeling ostracize and criticize me behind my back. There are no repercussions nor recourse for this. Even if I claim discrimination, how could someone prove anything? How can I access services via customer service when I have to sell my personality like a salesman to even be treated like a human being? Finding doctors specialized in autism is also a challenge. Even in mental health specialties, many doctors avoid learning about or diagnosing it. For people like me, these challenges manifest as agoraphobia and misanthropy.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Many learning disabilities associated with autism aren't screened for early enough (if at all) thereby permanently stunting our full potential. This impacts our economic success as well as our self esteem. Even worse disabilities can put us at the mercy of whomsoever has the shortest patience that day.
What additional research is needed to help address co-occurring conditions for autistic people?	We need AUTISTIC led research to examine the connections/causations/correlations of autism and its comorbidities. We DO NOT WANT AUTISM SPEAKS to have any involvement in this process due to their intense stigmatization of autism. If we understand the methods by which autism causes distress, we may yield therapeutic treatments for sensory issues, shutdowns, meltdowns, and more. If we can diminish the more destructive elements, the creativity, joy, and diversity of thought that autism can bring can take center stage.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	One simple to implement accommodation is to allow for more Healthcare and government services to be accessed non verbally. This means via a website, app, or other written or typed medium. The main issue overall is access at all. Many Healthcare providers have very little knowledge of autism. Specialized autism care is practically nonexistent to most people. Ideally, reasonable access to diagnosis with a protocol to refer out for comorbid condition screenings would be a start.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I think that because of my agoraphobia and higher degree of education, i was able to accept and understand the conditions of the pandemic and follow protocols easier than most allistic (non autistic) people. I also find that many are still struggling with a return to pre-pandemic life because the lockdowns actually allowed us to work in our own homes and have more agency in our day to day lives. Masks hid flat expressions. Work from home let us control our environment (sound, temperature, lighting, etc).
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	The increase in remote work and services was a huge, but short lasting win for autistic workers. We're largely disconnected from society by non autistic people, so the mental health impacts didn't hit our community as hard. I wish remote work was the standard.

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Alex Curtis
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory, motor, and sleep disturbances are the most common I have found. I take melatonin at night to help avoid waking up repeatedly, not being able to sleep, etc. For sensory I wear sound canceling headphones and avoid certain textures. Sometimes this makes it difficult to go to certain loud places.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For me, the most is suicidality, self injurious behavior (self harm), depression, and anxiety. I've been to a mental hospital before and were/am going to therapy to help these things too. These challenges cause me to struggle with motivation, relationships, and self-esteem. It can be hard to escape these at times.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	I think the additional research needed to help address co-occurring conditions for autistic people is not just bringing awareness but acceptance of autism. Please research more into biological women (AFAB) with autism because it makes it very hard to get a diagnosis. Also, into other mental health conditions/disorders and how they can come from or relate with autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I think the ability to have access to earplugs/sound canceling headphones/quieter space options, and overall equity when accessing and using the same services as atypical people.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It has spread more awareness about mental health, but it also shut us in and made people see us differently.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	There is an increased use of remote work and school, and disruption in in-person therapy or other resources.

Name	Alexandra Carlson
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I can only speak to personal experience. It can be hard to sort out where the problem is. And a problem with one part can cause a cascade of problems with the others. Am I depressed because there's no sunlight? Because my thyroid is low? Because my insulin resistance is graduating to diabetes and I'm starving while gaining weight at the same time because government nutritional information told us fat is bad and shoved tons of extra sugar in all foods? Or is it autistic burnout... which was never a possibility because nobody recognized I am autistic until I was 30. Getting anything diagnosed and finding a treatment was difficult because of this. My pediatrician told my mother being moody at age 10 was normal, but then we discovered my thyroid was low, so solving that should have solved everything, but it didn't... etc.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	In my case, because my autism was not recognized, my psychiatrist accused me of lying. I was convinced I was lazy and unable to handle pressure. A lot of situational depression occurred due to feelings of ill-fit, being forced to pretend to be 'normal', not given space when I needed it, etc. Which then was a feedback loop between depression and burnout. When indications of self-harm were discovered, I was harassed by professionals, which only made me want to hurt myself more because now I was overwhelmed. Meltdown could trigger self-harm but it was treated as depression-led suicidality rather than a case of being overwhelmed, so the "solution" was to keep bothering me instead of letting me cool down.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	In my case, it's all about recognizing autism as separate from the co-occurring conditions. And that the solutions to problems need to take into account the autism as the standard solutions may be wrong or incomplete.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Screening and recognition for autism itself. Mental health support in general. For everyone, regardless of income. Ways to connect with medical professionals that does not involve being on hold for two hours and speaking to a receptionist who cannot help you. MyChart is awesome for this - I can send an email type message directly to my doctor who can respond for non-emergencies. I have excellent insurance and live in a place where I can access good care. Many people don't. Universal healthcare, please.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	I love video meetings (vs in person). I love being able to order food. I love self-checkouts. I love the explosion of discussions about mental health and recognition that addressing it is important. I worry that many children weren't socialized properly during lockdown and remote learning. They didn't get support services or testing and there are still shortages. Poverty here is still awful - mental health suffers when people's needs aren't met. Problems that existed prior to the lockdown still exist. Universal healthcare. Universal basic income. Universal Housing. Hell, universal internet access. Still upset that my city didn't figure out how to give all kids access to the

in-person social interactions and obligations)	internet during remote learning - that the school district had to shell out for hotspots rather than access to information and education being treated like a basic human need.
--	---

Name	Alexandra Hathaway
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Understanding of complex health needs by medical professionals, lack of autism accessibility in physical health care providers offices and lack of physical condition accessibility in mental health care provider offices,
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of autism education in therapists and other mental health care providers, understanding the difference between your diagnoses and not having another condition misdiagnosed because of overlapping conditions
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Difficulty understanding education and care information that is not written in plain language or in an accessible way
What additional research is needed to help address co-occurring conditions for autistic people?	Understanding why autism Co occurs with certain conditions
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Lack of accessibility because of a lack of wide spread masking and following proper protocols to avoid mass infection. Aggravation of symptoms from covid-19 infection.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increase in remote access which is a good thing

Name	Alexandra Hayman
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Undiagnosed Ehlers Danlos syndrome or HEDS, possible POTS, sleep problems (getting to sleep), sensory issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety disorder in my case Generalized anxiety disorder and bipolar 2 and a past history of NSSI and past suicidality prior to my clinical diagnosis/identification as autistic.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disability in mathematics since childhood, intellectual impairment and was speech delayed in childhood and fine motor skills delayed.
What additional research is needed to help address co-occurring conditions for autistic people?	Research the prevalence of autism and Ehlers Danlos syndrome/HEDS, POTS, in autistic people, study more women and girls so that future generations can get identified younger than I did.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access and more services for autistic adults in all 50 states and make it easier to get SSDI, make it less difficult for renewing Link cards, decrease the wait time on the PUNS list and time waiting for funds from the state.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The covid 19 pandemic caused me to isolate myself so much more and thus my mask slipped and my therapist/psychologist suspected that I was autistic and wanted to get me assessed again in 2021. I also immensely became depressed when we were home for so long and couldn't function at all. I also got covid in April 2022 and after I had covid I started having signs and symptoms of Ehlers Danlos syndrome or HEDS and POTS.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth/virtual therapy sessions, decreased socializing in person, forced isolation, increased depression.

Name	Alexie Herrmann
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy, connective tissue disorders, hypotonia, fine and gross motor challenges, sleep issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, trauma, suicidal thoughts.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communicate issues and lack of access to accessible communication options Lack of appropriate educational support for co-occurring disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	More research into connective tissues disorders, the cause of connection between autism and epilepsy, therapies that aren't ABA that are helpful, what educational strategies are effective.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More ABA alternatives, insurance not requiring so many prior authorizations, insurance allowing sooner refills, more Medicaid covered providers, more Medicaid waivers, creating better living spaces that are accessible, easier access aac devices, more training to SLPs on aac devices, more Neurodivergent Affirming practices and trainings for the medical field, increasing help so wait lists aren't so long, covering hippo therapy under insurance.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Lost motor skills that weren't able to be gained. Mental health struggles. Social skills struggles.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Lack of access to stores being open 24/7. Pharmacy hours being limited. More difficulties getting medicine filled in a timely matter. Less support people in schools.

Name	Alia Campagnone
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders, vascular compressions
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Stress,aggrivation, adhd, suicidality
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities.
What additional research is needed to help address co-occurring conditions for autistic people?	Research needs to be done on treatments& cures to help manage these co occurring conditions. Vascular compressions need significant research.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Provider patient interactions. Also to encourage autistic individuals to go into healthcare since a lot of the wording we use neurotypical cannot understand.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It added to the tipping point of my body.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive impact on telehealth Negative impact on providers thinking we are faking even worse.

Name	Alicia Whaling
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Insomnia, sensory issues, food sensitivity, digestive issues, headaches, widespread pain, functional regression
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, OCD, ADHD, PTSD, night terrors, sleep paralysis, suicidal ideation, self harm
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	not being able to socialize without extreme effort, never feeling accepted/constant fear of rejection, unable to maintain employment, all side effects from medication, broken relationships,
What additional research is needed to help address co-occurring conditions for autistic people?	Study all ages, all genders, actually use a spectrum instead of a line to measure, research masking
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Make a diagnosis accessible and affordable, widen the assistance available both physically and financially, force insurance to cover co morbidities, institute job security measures
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	People started unmasking during lockdown and isolation. Now it's too hard to mask again, so mental health issues are made worse

Name	Allison Barcott, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Our son's sleep challenges began in infancy when we had to resort to using the sound of a hairdryer to soothe him and continued into adolescence with significant anxiety at bedtime every night. At age 15, prescription medication finally brought it under control. However, that medication has side effects that we must continually watch. Diagnosed with Sensory Modulation Disorder at age 4, he put in 3+ years of OT work, yet still struggles to cope with the noise, smells, and visual overwhelm of everyday life. As a hidden disability, it is particularly insidious at school, as staff don't understand how difficult just being at school is for him.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge for our family has been the lack of psychological therapies (and practices) that have been adapted (or created for) autistic individuals (let alone Neurodiverse informed!) Our son had been diagnosed with ADHD, LDs, and Sensory Modulation Disorder by 3rd grade; however, his ASD was missed until he was 14. Over that time, his anxiety grew into depression, school avoidance, and suicidal ideation. As we sought treatment for him from well-respected psychological practices, he continued to (scream) that they didn't understand. After receiving the autism diagnosis, I began looking deeper into scientific studies on these therapies (CBT, DBT, etc.). I saw that while some have been found to be "helpful" for those on the autism spectrum, it is typically at much lower rates than neurotypicals. However, when those therapies have been explicitly adapted for neurodivergent individuals, the rates are much higher. Our son's mix of diagnoses makes this kind of individualized support imperative. However, finding clinicians who use or even know about these adaptations is like finding the proverbial needle in the haystack. We've learned this the hard way after putting our son into programs that may have actually done him harm. While we have found a therapist who we think will be helpful, uncovering anything like an IOP or PHP is beyond hope. Without that, his return to school will be an excruciatingly long and arduous process at best.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Our son's learning disabilities contribute significantly to his anxiety/depression on a daily basis. He continually hears and sees that he is slower and less able than his peers. When supports that help him have been found, staff has not been helpful in making it easy for him to access them. IEPs do not seem to get read by anyone other than the RTSE. Because we remained in the dark for so long about his ASD, he struggled on his own with social communication, both with peers and adults. When he needed to break-off from a friend who had become a bully, trying to do so put him in a traumatic meltdown. When overwhelmed by school, he was often unable to speak, so he could not advocate for what he needed with adults. When he would try to do so, the typical response was that he was overreacting and should just "get over it." Better paraeducators were at least kind, but others were not only untrained and uneducated enough in the subject but uncaring as well.
What additional research is needed to help address co-occurring conditions for autistic people?	We need more research on what WORKS for those with ASD, not just what we can adapt for them. (Both in meds and psychology) We need to train all behavioral health clinicians in everything about ASD!!! From diagnosis to therapy, there seems to be a massive lack of understanding in the field of what researchers have learned about ASD in the last 20 years. I recently read a bit of research done on how clinicians felt regarding treating those with autism, and it all came down to how much training they had had on ASD. More research in this area will help clinicians understand how important that

	<p>training is. We are sick of being told we are helicopter parents and need to tough it out when what needs to happen is that they need to learn how to slow down, be explicit, precise, and earn patient's trust. Without proper training, they should not be working with neurodiverse patients. We need research to show the lack of availability of specialized behavioral health care for those with ASD. Thus far, I have yet to find an IOP or PHP appropriate for the neurodiverse community. My husband and I live in fear of the day that we are forced to take our son to the emergency room for psychological evaluation--we've seen all too well how wrong it usually goes for anyone who is not neurotypical.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Insurance: Currently, if you have co-occurring behavioral health conditions (say ASD and anxiety,) you will need to pay from a clinician who is either "Out of Network" or out of your own pocket. The vast majority of clinicians trained in more complex conditions do not currently accept any insurance. Autistic advocacy needs to be done to push insurance agencies and clinicians to allow those with ASD to access full coverage for more highly trained personnel. Services: As I've stated earlier in this questionnaire, there is a significant lack of behavioral health clinicians trained to work with neurodiverse patients. Somehow, many professionals seem to think that those with ASD can leap the hurdles to access the therapy they are offering.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>My autistic son was completely unable to interact with tele-school during the 2020-2021 school year. However, it is the increased use of tele-everything that is negatively impacting his overall development. While he enjoys conversing with friends over "discord," I've seen that the benefit to him from services like behavioral health therapy are cut in half when done on screen. He is at a point where he'd like to improve his social skills but programs like "PEERS" are only being offer virtually now. If he is eventually able to attend school again, he will need tutors to support his academic losses. I have only found one agency that is still operating in person, and their rates are almost double.</p>

Name	Allissa
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	To me keeping calm when it is needed by others. To be experiencing issues caused by or in tandem to autism and then having others not understand and now have to shove it down and essentially pretend they aren't happening or to have a doctor tell us there is nothing wrong its in your head.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The depression that is constant and the anxiety that has been there for as long as I can remember. The attention issues that have just been dismissed by every doctor. It all always feels dismissed by all professionals.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Never understanding the social situations no matter how they are explained. Constantly being/feeling on the outside. No one seems to care.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	having doctors who don't have a stigma against autism and will listen and hear the patient.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The option to work from home has helped immensely for my mental health. The social expectation when in the office is so draining and makes me want to not work. Though I do appreciate that I go in once a week. Any more than that is draining. The options for no face to face interaction in most places also helps me when I want to go out for food or shopping but having an option where there is no talking is helpful.

Name	Allyson P., Autistic Adult
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Fibromyalgia/chronic pain, ME/CFS, dyspraxia, insomnia, IBS, food intolerances, and misophonia/sound sensitivity.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, social isolation, ADHD (forgetfulness and disorganization), OCD (having to have things just so), and PTSD from mistreatment or abuse by others.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research to find out more about how ASD is connected to other mental health disorders, but especially ADHD and OCD; and to find out how it relates to eating problems such as ARFID.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Provide more support for adults on the lower needs end of the spectrum. Educate more providers on how autism presents in women and girls so that they don't fly under the radar. Put more money towards therapy other than ABA.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It's made it a lot harder to go out and interact with others, which we need just as much as neurotypicals. If anything it has stunted my social development.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive: more opportunities to work from home, more access to telehealth. Less pressure to perform socially. Negative: less opportunity to make connections with people, lots of disruption to routines, people seem more hostile.

Name	Alycia Halladay, Autism Science Foundation/Alliance for the Genetic Etiologies of Neurodevelopmental Disorders and Autism
Demographic	Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	<p>This response is being submitted on behalf of AGENDA, or the Alliance for the Genetic Etiologies of Neurodevelopmental Disorders and Autism, a group of patient advocacy groups, parents, researchers, and stakeholders with rare genetic forms of autism, many times either de-novo or recessive inherited mutations. Almost all these individuals meet the criteria for a neurodevelopmental disorder, which is not surprising because of the function of the genes impacted. A high percentage also meets the criteria for an autism diagnosis. These genes are pleiotropic, and in many cases are biologically linked to the co-occurring conditions. Therefore, it is critical that those with these conditions have genetic testing to better understand and possibly treat the condition.</p> <ul style="list-style-type: none"> • Epilepsy / Seizures • GI • Catatonia • pulmonary/respiratory • Hypotonia - scoliosis, difficulty coordinating cough response, musculoskeletal issues • Susceptibility to infection • Sleep problems, • Pain tolerance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	<p>Meng-Chuan Lai wrote an excellent review last year of these co-occurring (or co-morbid, depending on the condition itself) mental health issues in ASD. This review highlights an often overlooked issue, which is catatonia. This condition is seen more often in those with rare genetic disorders and is often deadly. In addition, intellectual disability and being minimally verbal can straddle the border of physical and mental health conditions. The stigma associated with IDD and MV ability is delaying appropriate treatments and supports and leaves families feeling isolated. Being intellectually disabled and/or minimally verbal may lead to behaviors such as aggressive behavior and self-injury. While mentioned in this RFA, these two things are not in themselves mental health conditions, they may be behaviors that are the result of mental health or even physical health (for example GI) disorders. Other behaviors include elopement and parental abuse. Parental abuse is often stigmatized, exacerbating mental health issues across the family. There is a limited understanding of the most effective interventions to help non-speaking individuals communicate, and many are turning to non-evidence based and potentially harmful interventions. Part of the problem is that AAC devices, which are helpful if used appropriately are not accessible and training is poor.</p>
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	<p>In people with ASD/NDD, there is an especially complicated interplay between the behavioral phenotypes of autism and other health conditions. For example, the inability to communicate discomfort or pain can lead to delays in receiving treatment for things like earaches, dental problems, appendicitis, or other conditions, leading to unnecessary suffering and worse outcomes. The inability to understand language or follow instructions becomes especially dangerous when individuals with ASD have other conditions like epilepsy. This can lead to any number of additional problems, such as poor compliance with treatments or injury from falls. In fact, this can be what necessitates having a caregiver within arm's reach 24-7. Sleep problems and behavioral challenges are an especially difficult combination. Individuals with self-injurious, aggressive, destructive behaviors, or other challenging behaviors, require a very high level of support in the middle of the night, when parents need sleep and other caregivers are not available. The real issue is that autism greatly magnifies the impacts of other health conditions.</p>

<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<ul style="list-style-type: none"> ● Studies that address a direct link, not indirect assumptions, about the mechanisms of co-occurring conditions linked to autism. ● Genes are not just in the brain they are all over the body. Better understanding of genetic underpinnings may lead to interventions that target body parts other than the brain. ● Genetic findings could lead to preventative medications or direction on the right behavioral interventions. ● Gene therapy to treat comorbid conditions are necessary. ● Important to include patient-reported outcomes rather than just traditional outcomes. ● It is also important to explore the mechanisms of co-occurring conditions whether a genetic lesion can be identified. There is insufficient funding and no coordination across NIH institutes to advance ASD GI research, sleep research, or even epilepsy research. This is where we really see the unintended consequences of silos of expertise by the institutes. It would be transformative if there were trans-NIH initiatives that could bring together, say NIDDK, NIMH, NINDS, and NICHD to advance GI research in ASD.
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<ul style="list-style-type: none"> ● First and most importantly, we need better training and more clinicians and educators to deliver interventions and support. There are not enough clinicians and child psychiatrists are rarely trained to work in autism. ABA therapists are not available. ER doctors are not trained to deal with psychiatric crises, they focus more on the proximal physical conditions, and have a more “treat-em and street-em” philosophy. That’s the nature of an ER. It’s not meant to be an inpatient facility and is often the last hope in critical situations. Schools should also ● Because there are so few well trained clinicians long waitlists for trained clinicians who are experienced to help families (neurologists, developmental pediatrician, GI doctors, etc.). ● Family training, support for caregivers ● Mental Health Support for families - potentially through patient advocacy groups? ● Increased opportunities for socialization of families who feel isolated. ● Medicaid Reevaluations for autism/genetic conditions are unnecessary. Severe IDD rarely changes after the age of 8. The money and time that is being spent on re-evaluations, what are the purpose of these re-evaluations?
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Isolation and masking during COVID (while necessary to prevent the spread of infection) was especially difficult on people with autism, who found themselves further isolated and had difficulty engaging socially. Additionally, social cues and expressions can be difficult to read on Zoom.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>One bright spot in the pandemic was the expansion of telehealth opportunities for families. In fact, telehealth was a blessing for some families (and found to be helpful for autistic adults with mental health issues) but after the pandemic, the ability to cross state lines for interventions/support via telehealth stopped. Accessibility to telehealth and to clinicians across state lines should be re-introduced and encouraged. In fact, some people got more access to services during the pandemic and now that has ended. Also, the ability to prescribe controlled substances across state lines should be reinstated.</p>

Name	Alyssa J. Pearson, New Mexico Department of Agriculture
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders make it difficult to work outside of the home. Sleep disturbances make it difficult to reliably make it to work at 8 a.m.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD - makes it difficult to act appropriately in extended social interactions and meetings. Anxiety makes it so that inappropriate behavior in social interactions leads to even less of an ability to act appropriately in future social interactions. This ultimately causes rejection sensitivity dysphoria where it becomes difficult to have professional relationships in the long term with neurotypical people.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research needs to be done showing that teleworking/working from home is a valid disability accommodation for people with autism to improve their job outcomes and employment satisfaction instead of being perceived as an attempt to goldbrick.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Accessibility of employment and improvements to the disability reporting services to avoid retaliation.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Exacerbated depression. Also made it so that I realized how much happier I am working from home which has made returning to office absolutely terrible.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased remote work and school was a positive development until it started to be taken away. However, I appreciate the drastic uptake in the use of asynchronous and written communications methods such as Teams/Slack, as well as digital record keeping.

Name	Alyssa Stephenson
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal issues, sensory needs, sleep problems, issues with eating
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I'm adhd with depression and anxiety as well as being autistic. My personal biggest challenge is that few mental health providers realize that my treatment plan has to look different from non autistic people with these same issues or it's not going to work.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication issues are the hardest for me. Partly due to trouble recognizing facial expressions and tone and partly due to auditory processing disorder
What additional research is needed to help address co-occurring conditions for autistic people?	Research how various mental disorders effect autistic people differently than non autistic people
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Allow more options for therapy for families on medicaid that isn't aba, start allowing self diagnosed autistic people to access therapies that may help them
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth access, remote work access, and reduced social interaction for me was positive

Name	Amanda
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances are very challenging as a lack of sleep makes it impossible for both the child and parents to function well. Sensory challenges are also difficult to carry out daily tasks and have children calm.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	One of the biggest challenges is PDA and how it presents. It is not recognized as well as other conditions and needs to be added to the DSM. It creates significant challenges around aggression, child to parent violence, school, and sibling relationships. It is also difficult finding professionals who know about it. FASD is another difficult one as many people will not diagnose both FASD and Autism, even though it can be quite common to have both. More assessors and professionals need to be aware of PDA.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Intellectual disabilities and learning disabilities make school very challenging. They often don't get the support they need in the school system. Social challenges can also be difficult if they are not able to keep up with their peers.
What additional research is needed to help address co-occurring conditions for autistic people?	More research is needed on PDA, how it presents, how to assess, and how to support. Additionally, more research needs to occur on hard-to-spot autism, as well as how autism presents in girls.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Have more coverage for assessments, as private assessments are very expensive. Supports should also be covered just like diabetes medication is, as they are both health conditions.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Many parents lost their jobs over ridiculous mandates so were unable to afford services for their children. Many autistic children also couldn't manage masks due to sensory needs or language needs, and were ostracized at school or kept from public places.

Name	Amanda
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	sensory challenges, especially overstimulation of noise and touch. I also work with patients who seem to have much more serious/common hypermobility disorders that greatly affect their functioning.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am a mental health counselor, I am autistic and work with quite a few patients on the spectrum, the vast majority of them experienced trauma based on their social behavior and/or limitations vocationally/academically with peers through their lives. Many of them have had higher incidences of suicidal ideations and self harm due to burnout.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Social isolation and loneliness, stereotyping about what is and what is not a sign or aspect of autism spectrum disorder, time management, hygiene skills, and emotional expressiveness.
What additional research is needed to help address co-occurring conditions for autistic people?	I know I personally would have benefited from more research into the emotional depth of autistic people, as I believe the stereotypes often frame us as cold/without empathy when I have found this very untrue in my professional work as well as with myself and family members on the spectrum. I think understanding how it is linked with physical issues (hypermobility, POTS, GI problems) as well as the impact of "masking" would be very beneficial.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	It is almost impossible for anyone over 18 to get a thorough assessment and diagnosis of autism in the state of new york without paying exorbitant prices out of pocket (over \$6000 in general). When I was in graduate school, the only training available was ABA style therapy which I feel is inappropriate, and neurotypical providers are at a loss as to how to help their patients.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	increased social isolation, more difficulty finding meaningful work.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Amanda Halloran
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	co-occurring illness is a huge issue for my family member who has both autism and mental illness; finding treatment is next to impossible as doctors want to treat one illness/symptom at a time rather than treating the entire person. They have gastro issues, a sleep disorder, sensitivity to chemicals against their skin & additional sensory disturbances.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My family member with autism also has bi-polar disorder and ADD. She has a history of trying medications that do not work or exacerbate some symptoms while treating others. It feels like a merry-go-round of puzzling symptoms with no answer as to what is going on. She is also extremely sensitive to making and keeping friends, especially love relationships.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For my family member, we had a tough time finding answers to her physical, mental, and learning disability in the education system. Tight schedules, as well as expectations that everyone learns the same, pushed her into private schools. They also had no answer, and she graduated with a GED rather than a high school diploma. It has been hard on her self-esteem and in her job search as a young adult.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	In the state of SC, there is no safe place for the mental health treatment for those with co-occurring disorders, most especially autism. Patients in search of help from state agencies are tossed from agency to agency as no one agency wants to take responsibility for them. In addition, SC does not have Medicaid expansion so access to proper treatment is decreased for the entire community.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increased isolation
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I would say that a lack of treatment for mental illness (along with autism) is the biggest challenge. For those of us in SC, treatment of those with co-occurring disorders is bleak as the state agencies offering the answers are the same: they throw their hands up and act as if treatment for these folks is not their responsibility.

Name	Amanda Kulesza
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, ADHD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Autism in women/girls
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for testing, service systems issues, and patient-provider interactions
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Amanda McCray, Autistic mom raising autistic kids
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory processing disorder. The feeling of a shirt can feel like you are physically on fire. Eating challenges. Being physically incapable of eating because food is the wrong texture for days. The inability to find something to eat is maddening.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression and anxiety from having to act like a neurotypical. Masking is exhausting. Not knowing why you don't understand what the right behavior is in the situation. The mental load to pull out that learned information in the rights Ettinger at the right time is exhausting. The strong sense of justice too. The world is on fire and we have to go to work?
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Auditory processing disorder. Sometimes the words just are not wording. "Can you hand me the remote" should not sound like "The cat became a stripper". Why does that happen? Also, why are most of us dyslexic? And why isn't this being screened for in the classroom?
What additional research is needed to help address co-occurring conditions for autistic people?	The neuroscience behind it. What is different in neurotypicals and neurodivergents? What is caused by the trauma society creates, ie depression and anxiety verses what is caused by different neuropathways like sensory processing disorder and pathological demand avoidance.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better trauma responses by the mental health community. ABA needs to go. We need to teach people with autism how to be themselves within society and not try to fit into a society that is not accepting. There needs to be evidence based therapy that teaches coping mechanisms to deal with the social backlash from society. Until society changes.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It made it hard to reintegration to society. Social skills are learned from experience. With autistic people, they have to understand they "why". We understood the why with covid. The problem was, there was skills that were lost with the lock down. Resources were greatly reduced. The world became an autistic person's playground. It was quiet and there were a lot less people to try and fit in with. Then you took that away and expected a person who can't do change to just reintegrate.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think covid gave some people an opportunity to educate themselves on autism. Many people came out of it with a different understanding of society and how they fit in. I think remote work/school was a good thing and a bad thing. Autistic people need social interaction more so than neurotypicals. But they need it calmer and quieter. It gave them a space for that, but took away the much needed face to face interactions. It's easy to hide when you don't have to and that's not healthy.

Name	Amanda Saffell
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep apnea, insomnia, ARFID, sensory sensitivity, ADHD are all often co occurring. Sleep apnea and insomnia limit the sleep necessary for functioning. Autistic people do not rely on 8 hours of sleep and can often function extremely well with 6 or less. Autistic people may sleep in short intervals more frequently. ARFID and sensory sensitivities make eating more ritualistic. Autistic people often prefer the same foods and textures over new options. They will have patterns of eating because the brain will eventually process the food as “different” and a new cycle will start. This is most likely due to our evolutionary history as hunter gatherers when a bison could last weeks, or we were in an area with more edible vegetation. Co morbid ADHD points to this ancestral commonality as well. The intervals of sleep, food and sensory intake, and ADHD functions would have been highly beneficial in humanities primitive development. I would argue that a lot of our “challenges” are only challenges in our current society and environments. In the right environment most autistic people would not see them as challenges but beneficial skills.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The overwhelming sense of justice. It causes an enormous mental and emotional toll on autistic people to see the injustice that continues to happen in our world. For thousands of years humans have been war stricken by that hands of other humans who made up something the other guy didn't like; see borders, races, money, etc. We see the cycles of every past civilization, we know where changes should be made, yet they never are and because such it weighs significantly on us. This is where depression, anxiety, suicidality stem. Per my last response a lot of “challenges” are only challenges under our current leadership and society.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Consider the possibility that some conditions are not co morbid but rather the symptom of society. Also research the impact of society on autism and how our role would be more significant in a society that encourages differences instead of belittles them. Research how the end of war, increased healthcare, removal of excessive wealth would impact autism. I'd bet there would be significant data that shows autistic people thrive in a peaceful society with community based environments.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	See all previous responses. The best way to help autistic people is to create a society that cares more about people than money. Healthcare, free education, and more services will do nothing if we continue to be forced to pay taxes to fund wars, it means nothing if we don't have good healthcare, infrastructure, or education (see our laughable world rankings), it means nothing if your social services do not operate well (SSI, SSDI, DHS), it means nothing without the prerequisite of a well functioning society. You can put glitter on a pile of [profanity redacted] but it's still a pile of [profanity redacted]. When the [profanity redacted] decomposes it creates a beautiful flower though, isn't that funny?
What lasting impact has COVID-19 infection and illness had on co-	The lasting impact is the realization that our society is extremely fragile and ignorant.

<p>occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Quarantine showed us that if everything stopped we'd all still be ok. It showed us that our government is fragile and we have a huge impact on its functionality. It allowed most of us to truly discover life without built in systems, and how much better society would be without them. It showed us that our "challenges" are only challenges to NT people in a NT world.</p>

Name	Amber Robertson
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges I face daily are sensory issues, sleep challenges, and gastrointestinal problems. I am hyper aware of every sound and feeling in my environment, and am very sensitive to light. It's like my nervous system is constantly on high alert. The sensory overwhelm from leaving my home to do basic tasks like grocery shopping or sitting in the parent pickup line can cause me to be extremely anxious, exhausted, and frustrated. Meanwhile I struggle to sleep when I'm supposed to, and generally can't sleep until I'm too exhausted to be upright anymore, and then I struggle to wake up. Unfortunately I have paradoxical reactions to medications I've been prescribed to correct this. Finally, my stomach is always upset. If I eat anything, I'm nauseated. These things together make it challenging to function daily.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am not only autistic, but also ADHD, and I have clinical depression, anxiety disorder, panic disorder, and cPTSD. One of the symptoms I live with is suicidal ideation. My mental health suffers when I spend too much time masking, or in a place where I have a lot of sensory overwhelm, and I find I experience burnout more easily than my neuro-typical peers. I also live with chronic illness, which impacts my mental health, and unfortunately living with chronic pain is a constant source of sensory stimulation that can trigger burnout and shutdown.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have the learning disability, dyscalculia. I am struggling to get through college, and unfortunately my health insurance won't cover an adult diagnosis so I can get accommodations. Healthcare and mental healthcare in the US is so expensive, and insurance companies do the bare minimum, so unfortunately people like me just try to struggle through it. I'm honestly considering dropping out of college at this point.
What additional research is needed to help address co-occurring conditions for autistic people?	I think it would be beneficial to look at the paradoxical reactions a lot of autistic people have with medications. For instance, I was put on a stimulant to help me stay awake during the day, and it only makes me more exhausted. Certain antidepressants do the opposite for me and make me less functional, more depressed, and more suicidal. It would be helpful to know why that's happening and if it's possible to avoid those medications without having to try them first.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Literally every aspect of autism services for adults needs to be improved. My insurance didn't cover my diagnosis, and I'm still paying that off. It doesn't cover diagnosis for a lot of co-occurring stuff, either. Healthcare is absurdly expensive, and that includes mental healthcare. Providers need to be better educated on what autism can look like, especially in women and girls, as it's often misdiagnosed or underdiagnosed in us.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I developed chronic illness caused by the lasting effects of covid-19, and it's made me unable to work full-time, my mental health is in horrible shape, and I'm in constant pain. As an autistic adult woman who has autistic children and works in mental health extended services, I can tell you 100% that covid has set autistic people back mental health-wise.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	I think a lot of positives that have come out of covid include the addition of more remote work opportunities, increased options for telehealth, fewer social obligations, and more understanding toward those who are struggling mentally. That being said, I would have preferred to not have chronic illness and worse depression than ever. It wasn't a good trade.

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Ambree
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	With ADHD you're stuck in this paralysis on a lack of motivation. I need to do something but it's too understimulating and disturbs the routine. Nothing gets done. Then when you add mental illnesses like anxiety and depression it gets even worse because then you start hating yourself for it.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Possible causes and solution to the juxtaposition of having cooccurring disabilities
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Some kind of money and compensation for those of us who can't do traditional jobs that pay enough for us to live. Also lowering the cost of accomodations amd diagnoses!!!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The push for online school and learning on your own. They say it's "at your own pace" but in actuality they're not because the idea that you can do it whenever makes them a lot less sympathetic when you miss deadlines.

Name	Amelia
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have difficulty working in group settings due to physical pain, need for urgent bathroom breaks, and the sensory problems that come with hearing others fidget/chew/cough as well as the lighting and temperature. I have terrible sleep habits and often either need to work night shift which lowers my life expectancy or I go to work tired everyday on day shift. With my constant physical pain, I can't do a lot of manual labor jobs but am also told that sitting jobs are bad for me too. I feel like I cannot succeed in my own country.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have had depression, anxiety, ADHD, PTSD, and suicidal ideations since I was a child. I was a gifted student until highschool graduation and I floundered in college due to extreme depression, anxiety, and ADHD. I have tried to take my own life many times. It is difficult waking up everyday. To get mental health treatment, I have to have a job (not designed for me to succeed in) and then I have to wade through long waiting times, terrible insurance authorization issues, high costs of medication that I can't afford even with a job even if it means I could eventually earn more, and it is nearly impossible to get good treatment without trying multiple providers which each have long waiting lists.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I learned how to hide my communication problems very young, but I still struggle to understand rules and social norms that aren't expressly stated. This often leads to me being an outcast at work and school because people don't like me, no matter how hard I try. When I manage to fake my way into having friends, it makes me so tired that I can either do the things I need to do in order to be healthy or I can socialize. I don't get all of the above. It makes me so tired that I get burnt out and stop enjoying things or engaging with things and my depression gets exponentially worse. I often have to isolate for long periods after social interaction to try to recover.
What additional research is needed to help address co-occurring conditions for autistic people?	A lot. There is a massive connection for autism and trauma and it seems like no one knows which one comes first. For the majority of my 10+ years in therapy, I was treated with ABA therapy which is the equivalent of telling someone to "just do it", even if it makes them sad, makes them feel like they're lying to everyone, makes them tired, or makes them want to kill themselves. If you're honest about it making you feel bad, you're given more medicine to make you not kill yourself but then you're just an emotionless robot, fulfilling their capitalist duty to earn money and not complain. It's soul sucking.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverages need to be improved a lot. Medication is not affordable in the US whereas it is in most other major countries. Patient-provider interactions need heavier regulation. I had a psychologist tell me I was fine and had "smart people problems". I had no idea how to report him or get better quality help. Autism training should be given to all practitioners and not just ABA. Recognition in classrooms needs to be improved. If I was diagnosed sooner, I may have had access to more supports. I don't even know what options I have and since I was diagnosed so late and have to survive on my income, I can't get on disability or any services because if I quit I will be homeless and I have no family or friends. I feel like I will never get healthy here. More publications and early intervention will help people like me from becoming people like me.
What lasting impact has COVID-19 infection and illness had on co-	Since having COVID, I have had persistent sinus issues and congestion problems which exacerbate my colds, my bad sleep, everything. I think having masks and being encouraged to be respectful of people's space

<p>occurring physical and/or mental health conditions for autistic people?</p>	<p>honestly helped me. I like not having to police my expressions and masks made that possible. People being afraid of COVID meant I could walk in a grocery store and not get bumped or have someone invade my personal space. I felt more productive publicly, but that is going back to normal now and people are just as rude as before. I think it would have been worse if I was in school during COVID because I needed that forced social interaction to learn about people and, without that, my more difficult years would started earlier.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Reduced public transit meant I had to drive more, which is hard for me. I am still scared of public transit now because of how unsafe it seems to be and how everyone seems sick so often. Increased remote and hybrid work has been a godsend. I am often overstimulated in offices and by others, so having my own self-designed workspace where I can thrive is amazing and has helped my sanity tenfold. It allows me to take better breaks where I can try to manage my household chores better too. Increased telehealth has also been amazing. I no longer have to plan long commutes or worry that someone in the waiting room will get me sick. I also get to be in my safe spaces with less sensory input and focus on the appointment rather than my discomfort. Reduced social obligation has been a nice break, but the obligation part is what kept me social. I am learning how to be social on my own terms, but it is more difficult now than it previously seemed.</p>

Name	Amelia Cruz
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have a long history of gastrointestinal issues that went largely unexplained for most of my young life, as well as lifelong issues falling and staying asleep. My primary concern when it comes to co-occurring physical health conditions and autism is the tendency for the symptoms of autistic people to be ignored or not believed. I am a late-diagnosed autistic (diagnosed in my early 20s). When I was growing up, the things that bothered me were often written off as me being "too sensitive." The lights hurt my eyes? That's me being dramatic. The TV is on too loud? I'm the one being disruptive. This principle also applied to physical health issues. I would complain about gastrointestinal problems and I would be dismissed. Several years later, I discovered that my gallbladder wasn't working correctly, but I didn't learn about that until I had to get it surgically removed. Many autists have severe co-occurring conditions such as epilepsy, but I do not. There should be ample resources for those who do.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have both autism and ADHD, but I didn't receive these diagnoses until I was an adult. As a late-diagnosed, high-masking, AFAB autistic, depression and anxiety were by far the most significant challenges I have faced. In middle school, I noticed that I was different from my peers. My need for a specific fabric texture to fall asleep and emotional outbursts went from being quirky to bizarre. I paid attention to other girls – how they spoke, what they talked about and liked to do. Every waking moment of every day, I monitored and manipulated my behavior. This required a lot of energy, but I believed that I was "normal," so I berated myself for faking depression despite feeling a gnawing emptiness inside. When you play the part of an emotionless robot for 10-15 years, waking up to the realization that you were not a freak, but a perfectly normal autistic girl is earth-shattering. Yes, my autism is a disability, but it also saved my life. I no longer have passive suicidality. The take-away is that early accurate diagnosis is crucial, especially for high-masking, AFAB, and people of color. There need to be more clinicians trained with neurodiversity rather than pathology who understand that the autism spectrum is a color wheel of differences. More funding needs to go to studying girls, nonbinary folks, and people of color. The earlier autists are given language to describe themselves, the less likely they will be to experience the gut-wrenching emotional pain that I did.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I do not have any accompanying intellectual or communication disabilities. The only learning disability I have is ADHD, but my autism compensated for that just as my ADHD compensated for my autism. Where my ADHD couldn't focus, my autism usually could, and my ADHD allowed my brain to have an easier time switching between subjects. Because I was hyperlexic and have high verbal faculties, I don't experience many of the communication issues that other autists do. That being said, I want to highlight that just because an autistic person may seem unresponsive, that does not at all mean they are not experiencing a rich inner life nor does it mean that they are not communicating. Every autistic person communicates in their own way - gestures, AAC, echolalia, neologisms. All autists should be given the time and space to communicate in any way they see fit.
What additional research is needed to help address co-occurring conditions for autistic people?	Funding needs to be reallocated away from searches for a cure/cause of autism to studies on how it presents in underrepresented groups. Also, research into new ways for autists to communicate with each other as well as with allists. There is a lot of time and money spent trying to find ways to force autists into communicating as allistically as possible. I believe this is a

	<p>grave error. We do not need to train the autism out of autists. There is much to be learned from autistic people about the nature of language, speech, communication, and semantics. Instead of researching ways to "fix" us (with a cure, phony vitamin supplements, and/or Applied Behavior Analysis 'therapy', etc.), let's work together to find out more about autism as a valid way of life, so we can ease some of its more disabling aspects. More funding can also go into how allists perceive and respond to autists. The research lens is more often than not trained on the autistic child, and not on those holding the lens. How much of autism's disabling effect is a result of allistic people's treatment of us? Not all, of course, but I believe it's worth looking into. Finally, more attention should be paid to autistic adults. Despite popular belief, autistic children do in fact grow up to become autistic adults (if we're lucky).</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Most of my concerns when it comes to this issue are more widely applicable than just to autistic people. For example, I believe the American healthcare system needs a massive overhaul from just about every aspect possible. Insurance companies are greedy scalpers, medical professionals are either not given the time or are not interested in working with patients as individuals, and trained providers are few and far between in certain areas of the country. Fixing these things would be great for autistic and allistic people alike. For autistic people specifically, my concerns lie primarily with inclusive access to housing, education, and employment. The US tends to segregate autistic people from the general population - think of special ed classes, isolated housing institutions, the fact that most public spaces are not autism-friendly. Part of the stigma around autism comes from the fact that most allistic people have not met an autistic person. Their only frame of reference is Rain Man or The Good Doctor. So, while money should go to more accessible services for autistic people, I think it's equally important to find ways to provide these services without separating autistic people from everyone else. Allistic people have a lot to learn from autistic people; Finding ways to better incorporate autistic kids into the classroom, autistic adults into community spaces and neighborhoods, and all disabled people into public spaces might be a good start.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I've had Covid-19 twice. My long-Covid symptom was some nervous system irregularities. Autistic people are already prone to having issues with their nervous system, so I wasn't shocked by this. I have mitigated this issue with some supplements.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Speaking solely for myself, the aftermath of the pandemic has simultaneously improved several aspects of my life and highlighted how little most Americans care about disabled people. On the one hand, the pandemic allowed me enough time to think and feel for the first time in over a decade. If it hadn't been for Covid-19, I'm not sure I would have figured out I was autistic. It would certainly have taken a lot longer. For me, being allowed to stay home and attend/teach classes when overstimulated has been incredibly useful. I don't have to hem and haw as much about advocating for myself in that regard. On the other hand, the blatant disregard for mask mandates and Biden's eager declaration of the end of the pandemic has solidified for me how America thinks about its disabled citizens. If it weren't clear before 2020 how expendable disabled people are to the rest of the population, it is certainly clear now. Just because the pandemic is over for able-bodied people doesn't mean it's over for immunocompromised people. The lifting of pandemic protocols has contributed greatly to the segregation of disabled people, and I think that is a real shame.</p>

Name	American Academy of Pediatrics, American Academy of Pediatrics
Demographic	Representative of advocacy organization
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>One common challenge is delayed access to care related to the misinterpretation of physical symptoms that present in an autistic individual. Co-occurring physical health conditions can cause pain, but pain can be difficult for autistic people to communicate, which often results in delays in care and delays in intervention. Additionally, metabolic syndrome and obesity are significant challenges as a result of nutrition and/or feeding difficulties and side effects from medications. For example, weight gain and metabolic issues are common in older youth and adolescents, as food is often used as incentives for desired behavior, which can be exacerbated with poor access to recreational activities. Other co-occurring physical health conditions that coincide with many individuals on the spectrum having fine motor deficits, sensory sensitivities and oral motor deficits include gum disease, tooth decay, and total tooth loss. These conditions create challenges with eating, communication, socialization and their overall physical health. These conditions also coincide with access challenges because many individuals on the spectrum do not have the appropriate access for medical or dental treatment for these conditions and/or their autism-related symptoms, such as behavior issues, or touch, taste and texture sensitivities. This makes it very difficult for them to receive appropriate medical care, preventive care, or other programs and services needed to address these conditions.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Similar to the challenges caused by co-occurring physical health conditions, co-occurring mental health conditions can also cause diagnostic overshadowing for clinicians including inadequate or inaccurate prescribing of psychopharmacology, and delayed access to behavioral health services or other treatments. Due to siloed systems of services for mental health and developmental disabilities, autistic individuals with these co-occurring conditions frequently experience inequities in access to care, financial burden, and loss of employment for autistic people and/or their caregivers. Further, these conditions can cause isolation from community supports and community inclusion because of a lack of understanding about disabilities and mental health conditions. Co-occurring mental health conditions can also result in school avoidance and decreased learning. Anxiety, depression, and dysregulation interfere with optimizing learning and developmental outcomes over the course of childhood and adolescence by leading to school avoidance, missed instruction, and external behaviors that stimulate placement in separate classrooms and programs. Children need to feel safe, connected, and well-regulated to learn. The AAP recommends increasing focus on mental health and emotional regulation starting in early childhood and at the time of diagnosis in order to improve educational and developmental outcomes of children with autism.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>Overall, comprehensive oversight is a significant challenge. Coordination between settings such as schools, behavioral health care, mental health care, and pediatric care is a challenge as complete data and information is not always in one place to be able to make the right decisions in each setting. Lack of inclusion, communication access, and transition to adult services are significant challenges caused by co-occurring conditions in autism. Employers and educational systems are ill-equipped to support people with multiple disabilities in various settings, particularly in providing adaptive transportation. The presence of an IDD can result in bias and presumption of incompetence in people with lower cognitive and/or communication skills</p>

	<p>leading to a lack of inclusion. Families also often experience significant challenges in accessing augmentative and alternative communication or appropriate speech therapy support for children and youth with high communication support needs. Finally, better support through early adulthood is needed in recognition that developmental timelines can vary greatly and many people with autism continue to progress developmentally beyond the typical school age years. Some adults reach milestones such as driving, attending higher education, employment, or living independently at later ages than 18-21, yet school and adult transition programs end at these ages, leaving families with few supported options to help individuals continue to make progress.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>A clearer understanding of the real-world frequency and fluctuation of symptoms on a patient level is needed to obtain a more practical data set for clinicians to see patterns of behavior/symptoms associated with various co-occurring conditions. Most of the existing research is in “controlled” or non-real-life structures and is often too far delayed from the patient’s real experiences. Improved data collection processes including innovative tools like sleep tracking, urine/stool output, heart rate, and other forms of at home monitoring would significantly improve the ability to conduct research. Research on depression and suicide risk among autistic youth and adults, including causes and incidence, would help to address some co-occurring mental health conditions. Additionally, research on ways to prevent wandering, which is exacerbated by co-occurring mental health conditions, would be beneficial in reducing dangerous situations and outcomes such as drowning. Regarding development, further research on puberty in autistic youth, and reproductive health, would help determine the best treatment and prevention practices to address the increase in mental health conditions during and after puberty, specifically related to medications. Similarly, further research into effective behavioral strategies and/or medications to improve anxiety, aggression, self-injurious behavior, and obesity/metabolic syndrome would help address co-occurring conditions for autistic people as well.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Autistic people often receive late evaluations and interventions, resulting in poorer health outcomes. This inequity is caused by access issues, ableism, and bias in the healthcare system, which exacerbates challenges related to co-occurring conditions, deficits in communication, and differences in expressions of pain or other sensations. Autistic people need access to the same level of preventive services such as well visits and dental visits as everyone else in the United States. This requires a trained workforce that understands the IDD/ASD population and inclusive practices within therapy, medical care, mental health care, and dental care. Health care providers need better education on neurodiversity and ableism, and better support on how to help families navigate complex systems. Additionally, to achieve this, payer reform and differential payment structures are needed to allow for payment of support services so that people with IDD/ASD experience equitable care. Because it takes more time to modify clinical practices and procedures to include people with IDD/ASD, payers need to recognize this and allow for a modifier to be applied to serve this population equitably. Many healthcare systems are eliminating extended visit times in primary care, but even for providers who are allowed to give extended time for complex visits, knowing how to bill appropriately for their time is a complex skill and as a result, many end up not being compensated for the extended time.</p>

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Two of the main impacts of COVID-19 infection and illness on co-occurring physical and mental health conditions for autistic people are weight gain and increased anxiety which can cause difficulty with social re-integration. The delay in care due to the pandemic resulted in challenges related to feeding, constipation, and nutrition going unaddressed. Additionally, the pandemic increased the already lengthy wait times for specialty care, resulting in delayed autism diagnoses and services. Because of these challenges, the AAP recommends further research into increasing autism diagnoses within the primary care setting. Overall, there has been a decrease in health care services, with people leaving the health care field as a profession, resulting in a decrease in progress toward goals related to co-occurring physical and/or mental health conditions. Both caregivers and individuals on the spectrum have shown decreased mental and physical health since the onset of the pandemic.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>One of the positive impacts is the increased use of telehealth which helped improve access to medical and mental health care for some autistic people, but some payers and states are reversing some of the increased telehealth access and flexibilities from the pandemic. The increase in access to virtual school and work options has proved to be a benefit to some individuals, as more robust online communities and communication tools became available during the pandemic. Additionally, these remote options have helped reduce access barriers such as transportation. One negative impact is the decrease in social experiences. For example, remote school learning can work well for some individuals, but can also result in increased feelings and reality of isolation for others. Additionally, some of the social experiences that autistic people participated in before the pandemic have not resumed due to a variety of reasons including lack of funding. Additionally, many autistic people have increased anxiety as a result of the pandemic and societal changes related to the fear of being exposed to or getting sick from COVID-19. The pandemic also significantly impacted access to healthcare services, which has resulted in delayed diagnoses, delayed behavior services, and a loss of healthcare providers. This has created a rise in behavior symptoms due to the delay in services, which has impacted social re-integration and increased caregiver burnout.</p>

Name	American Association of Psychiatric Pharmacists, American Association of Psychiatric Pharmacists (AAPP)
Demographic	Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Given that many physical health conditions co-occur with autism, one of the most significant challenges is increasing medication complexity (PMID: 28750547). This represents clinical challenges for the individual taking medication due to high pill burden as well as for providers prescribing medication who must manage complex drug-drug interactions and drug-disease interactions. Co-occurring physical conditions may limit medication options available to treat symptoms of autism or co-occurring mental health conditions. Additionally, increasing the number of medications can lead to more side effects, which can lead to a medication prescribing cascade where medications are added to treat a side effect from a medication. Another significant issue is the difficulties in communication between specialties, which could potentially lead to drug interactions or a fear of making medication changes to avoid exacerbating a physical condition. Board Certified Psychiatric Pharmacists (BCPPs) may serve as the bridge between multiple specialties to assist with medication management for autistic individuals in outpatient and inpatient settings. This public comment response has been compiled by BCPPs who work with autistic individuals, on behalf of the American Association of Psychiatric Pharmacists (AAPP).
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Similar challenges occur with co-occurring mental health conditions, including the number of medications prescribed and the potential for a medication prescribing cascade. Studies suggest individuals with a diagnosis of autism may be more likely to have certain side effects with psychotropic medications (PMID: 27592097). This highlights the importance of close monitoring and specialized care for autistic people with concurrent mental health conditions. Furthermore, autism may impact individuals in a variety of ways including sensory sensitivities. This may result in the need to pursue unique medication formulations like liquids or patches to align with an individual's needs. An additional challenge is the high prevalence of supplements (e.g., vitamins) that are used in this population (PMID: 26366192), resulting in drug interactions or side effects. Supplements may not be mentioned in a medication history which results in an incomplete medication list for providers to review and assess.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Given the treatment complexity that can occur with the combination of autism, co-occurring physical health conditions, and co-occurring mental health conditions, medical decision making can become a significant challenge. Depending on type of learning disability, developmental disability, intellectual disability and/or communication disability, extensive visit time may be needed to thoroughly review all treatment options in a way the individual can participate in their own medical decision making. This highlights the need for team-based care, but unfortunately, access to team members like BCPPs remains limited by variability in state legislation and reimbursement. Additionally, some individuals may have guardians who act as medical decision-makers. In these cases, coordination with guardians, caregivers, and the individual is crucial to ensuring successful treatment and monitoring of all co-occurring conditions.
What additional research is needed to help address co-occurring conditions for autistic people?	Research addressing co-occurring conditions in this population is minimal. Major pediatric clinical trials have clear exclusion criteria of ASD diagnosis. The wide spectrum and degree of clinical manifestations makes this population challenging to study and generalize treatment for. This has led

	<p>researchers to exclude certain levels of functioning or co-occurring conditions from clinical trials and introduce study biases. A meta-analysis of >300 studies pertinent to ASD found only 2% of participants to be nonverbal or minimally verbal, while the real-world population estimates 25-30% (PMID: 30867896). There are currently only 2 FDA-approved medications to treat co-occurring conditions specific to ASD (irritability; risperidone and aripiprazole). This means that medications are often used off-label in this population, increasing risk for inappropriate polypharmacy, lack of symptom-based prescribing, and overprescribing. Utilization of available resources such as BCPPs to conduct research in this area critical, as BCPPs are skilled in clinical trial evaluation and coordination.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>With a national average of only 14 child and adolescent psychiatrists per 100,000 children and ~800 board certified developmental-behavioral pediatricians in the U.S. for the 19 million children with developmental differences, addressing the increasing mental health and complex psychotropic medication needs of this population is difficult. While Innovative services have been created, they need to be expanded (PMID: 34210189). AAPP advocates for the inclusion of BCPPs in interprofessional teams that care for individuals with ASD to support these demands. Examples of services that BCPPs can collaboratively support include: 1) Care coordination/delivery: support transitions of care, coordinate care among service providers (e.g., school, community supports, ABA therapist), provide medication education, ensure timely access to medications (DOI: 10.1002/jac5.1880); 2) Access to care: BCPPs can help mitigate the provider shortage through collaborative, innovative, and practical strategies to improve quality of care; 3) Evidence-based use of psychotropic medications in the setting of high rates of psychiatric and medical comorbidities, increased risk for adverse effects, and increased likelihood of being prescribed high risk psychotropic medication regimens (e.g., more than three medications). Specific strategies can include psychotropic stewardship and comprehensive medication management (DOI: 10.1002/jac5.1880, PMID: 37063939).</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Autistic children are twice as likely to have an underlying condition that places them at high risk for severe illness from COVID, have orofacial sensitivities that makes wearing a mask challenging, and may be among family networks with higher vaccine hesitancy increasing their risk for contracting COVID-19 (PMID: 36799305, 36483100, 37147338). Young people's mental health was particularly impacted by the COVID-19 pandemic with increases in suicide attempts and related emergency department visits seen (PMID: 37910582). Autistic children had an increase in aggression, behavioral outbursts, and regression during COVID-19 restrictions (PMID: 32503172). Autistic children often struggle to communicate medical illness, and feeling physically unwell can lead to an increase in behavioral symptoms such as self-injurious behavior or aggression towards others. It is important to ensure treatment teams complete a thorough assessment to appropriately treat the underlying condition causing symptoms, potentially including COVID or other medical co-morbidities.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,</p>	<p>Telehealth care models were fast tracked at the start of the pandemic and have continued to be used as they provide many advantages such as savings on the cost of travel, reduced time away from work, and access in rural areas. With increasing prevalence of ASD, access to diagnostic assessments is crucial. Telehealth evaluations for children with suspected ASD can be completed effectively and have been shown to leave both providers and</p>

<p>increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>caregivers satisfied with the experience (PMID: 35579789). Family-centered interventions focusing on physical activity, executive function, and social skills have also demonstrated efficacy via video (PMID: 35184077). Innovative treatment delivery methods have been developed to remotely enhance social communication skills in autistic children, such as at home electronic games (PMID: 34788890). Psychiatric pharmacists are well positioned to complete medication management via telehealth appointments. BCPPs can reduce medication-related problems that autistic children have higher rates of, such as polypharmacy, and side effects from psychotropic medications. Additionally, telehealth visits can be utilized to answer patient and caregiver medication related questions, and support medication adherence (DOI: 10.1002/jac5.1880).</p>
--	---

Name	Amy
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Maintaining gainful employment is difficult because of sleep issues. Also, getting accommodations for sensory issues is difficult as employer's see noise canceling headphones as a safety issue (not able to hear fire alarms).
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD co-occurring with Autism has the individual always battling with themselves. We need routine but also crave novelty. We need some foods but get bored of them quickly. Its a daily battle
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	No matter how hard we try to be clear with what we say other people add implied meanings that aren't there so we're never understood.
What additional research is needed to help address co-occurring conditions for autistic people?	Research focused on the voices of Autistic individuals and NOT the perspective of those administrating the Research
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to services for Autistic adults, we don't grow out of Autism and adults with Autism need support services too
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Being left alone has been great, people keeping there distance from me has greatly improved my mental health. Not being expected to go to gatherings has also helped

Name	Amy Acevedo, Mother
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Visual impairment
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	suicidality
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Emotional intelligence
What additional research is needed to help address co-occurring conditions for autistic people?	public school involvement, resources, and diagnosis recognition
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	public school knowledge, acceptance, and recognition
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Amy Cox
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Severe sensory issues, rampant anxiety.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Much more research needs to be done on people like me, who weren't diagnosed until age 61ans were misdiagnosed and mistreated for decades with harmful drugs, and have absolutely no way of accessing any sort of meaningful help. 99% of services are for children. It would be a good idea to ask autistic people what they need. And finding out why so few physicians know anything about autism and related concerns.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	There are hardly ANY practitioners who work with autistic adults, and Medicare doesn't cover much if any of the care. And most know nothing about autism and related issues. More informed doctors, insurance coverage by Medicare, MUCH more help for adults, including people over 50.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Self checkout and mobile apps have been great! Less human contact and much faster service. Covid was great for me, because of enforced social distancing and more self serve options that lessened interpersonal contact.

Name	Amy Fowler
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Trying to walk a tight rope to manage competing needs followed by an exhausting cycle when I inevitably slip on the rope.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	This varies but for me as a caregiver it is the level of support and follow up needed to help my person needs to complete simple activities of daily living
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Not knowing what my son is thinking, if he is hurting, what hurts and how I can help
What additional research is needed to help address co-occurring conditions for autistic people?	I think instead of research caregivers need a menu of supports and services
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More of them and available during a variety times.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I feel fortunate that I was able to cobble together supports for my son. But the pressure of managing the services and supports have left me exhausted.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive: more curbside pick up makes it easier for me to get goods more easily Con: the staff shortages has made longer waits for even less services

Name	Ana Pereira, Mother of an amazing autistic boy
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son is three years old. He does not sleep thru the night, I don't know what a full nights sleep feels like anymore and that causes issues in the family. He has GI-issues and is very picky eater. he also self injures himself. Cant be taken out in public without some sort of restraint (due to eloping). We have not had the ability to rest or vacation in years. Also deters us from family reunions or functions that have a lot of people or noises so we don't have much of a social life as he begins to scream or hurt himself.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	he has self-injury behavior (bangs his head a lot). he is still too young to show any other mental health issues
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	He has very limited one word vocabulary. due to communication issues he has many break downs (tantrums) and displays frustration and impatience.
What additional research is needed to help address co-occurring conditions for autistic people?	There should be more parental outreach and information. almost like a autism 101 guide for parents of newly diagnosed children.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Medicaid should be allowed to be a secondary insurance coverage. Financial thresh holds should be increased. (personal example: my husband are in the middle class financially, due to the increase of prices in the recent economy we are not poor but also not rich. My primary insurance covers some of the therapies he needs with daily co-payments. there are other things that we need to provide for him but we cant add any more to our plate. we have not had the ability to vacation in years because we use all of our extra for his care. Diapering, speech and OT therapies, sensory items for home, however the fear of losing my job and not having insurance anymore at least for him to continue to cover his therapies is a very real and scary thought. We are having extreme issues getting Medicaid for the disabled to even approve coverage for him at any level. I am not looking for "free" I am looking for affordable. Someone to work with us. There are so many other things he will need as he gets older and I am not sure how we will be able to provide them for him. It was also very hard to get him diagnosed and for someone to follow his care. i was on a wait list for over 8 months and had to drive 1.5 hours to a hospital that provided this service.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Ananya Rishi
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	- Healthcare management. - Routinely self-care once provided with treatment plan. Organising and adjusting schedule based on sudden health flare-ups. - Commitment to preventive care. - Managing health-care and daily life. - Communicating accommodation needs.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	- Accommodations needed to perform at work/school/social settings. - Communication difficulties to healthcare providers. - Consistency in routine and medication. - Managing autistic burn-out alongside co-occurring mental health conditions. - Preventing traumatisation.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	- Accommodations in school. - Feeling understood and fitting in. - Feeling behind compared to others in social settings. - Difficulty accessing same events, opportunities, experiences as neurotypical individuals. - Time management.
What additional research is needed to help address co-occurring conditions for autistic people?	- Accommodating to needs without segregating. - How to respond to difficulties being faced at school/work. - Benefit of diagnosing comorbid conditions alongside autism diagnosis. - Healthcare courses for doctors to understand and address comorbid conditions when they know patient is autistic.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	- Insurance coverage. - Access to specialised neurodivergent health-care providers. - Removing disability-related discrimination.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	- Social anxiety. - Behind on social norms. - Antisocial behaviour. - Fear of being in public. - More comfort in virtual/indoor settings.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	- More remote opportunities. - AI assisted schedules. - More access to people online with similar conditions.

Name	Andie
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My sensory challenges cause significant challenges during my day-to-day life. College classes, especially those in large lecture halls with very close proximity to peers and lots of sensory stimuli, can be very difficult and can cause long lasting dysregulation. Many social events are simply not doable for me due to loud and unpredictable volumes and crowded conditions. This has made forming connection and friendships difficult.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety poses significant challenges in my life as an autistic person. I experience immense social anxiety related to my autism and struggling to understand social expectations, as well as immense anxiety stemming from any change in routine or expectation. Such anxiety can be very disrupting to my day and sense of well-being and make it difficult to complete regular tasks. In addition, I have obsessive compulsive disorder that has had a significant impact on my life and well-being. I experience depressive episodes in addition to heightened anxiety when I am experiencing autistic burn-out, as well.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Greater access to services, and greater education and awareness of support services is needed. As an autistic person it is difficult to grasp where to start to begin searching for resources that could assist me. I, personally, could benefit from more accessible and sensory friendly spaces and clear, direct instruction in daily life and tasks and know that many other autistic people struggle similarly with feeling as if we were not given the instruction manual for everything from social interaction to paying bills and doing taxes and this makes initiating such tasks very difficult. Greater insurance coverage is an absolute must, as well. Many autistic people, myself included, have to incredibly high prices out of pocket just to get a diagnosis, making it completely inaccessible to many. In addition, insurance coverage for support and services such as various forms of therapy and training should exist.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	

in-person social interactions and obligations)	
--	--

Name	Andrea Barlass
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have observed to see several children diagnosed with Autism Spectrum Disorder (ASD) also have a diagnosis of a developmental disorder, speech delays, sensory related concern and delays in ADL's (which are common symptoms/characteristic associated with ASD).
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have seen several co-occurring mental health diagnoses of ASD and ADHD, ASD and Depression and/or anxiety. I have occasionally seen co-occurring mental health diagnoses of ASD and Oppositional Defiant Disorder.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I think that the symptoms/behaviors/characteristics that are common or typical of individuals with ASD often get misdiagnosed as ADHD, anxiety, and ODD. I also think that ASD can be misdiagnosed for some individuals who may struggle socially, be anxious, or not fit the stereotypical "norm". A diagnoses of ASD can lead to difficulty in relationships for children, teens, and adults which is challenging and can lead to additional mental health conditions like depression and anxiety. The symptoms/traits/characteristics of ASD also create challenges that require alternative interventions for teaching. If someone isn't skilled in working with an individual living with ASD or understand that person's developmental capacities, the individual will have barriers to learning.
What additional research is needed to help address co-occurring conditions for autistic people?	Better screening measures and assessments, increased education for parents and care professionals, increased training for mental health professionals who work with this population, and more availability for testing to clarify diagnosis.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to services Affordability of services Public education/awareness of services available Providers educating caregivers and assisting with referral process or referring to a care coordinator who can assist caregivers who may not have as much health literacy as others. Insurance coverage abd removal of prior authorization for services. School assistance in educating parents (if there is a trained, licensed mental health clinician available). Normalizing utilization of asking for help and use of community resources.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	unsure
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Lack of availability of mental health care and or physical health care in general. - longer wait lists, disruptions in services, provider burnout/transfer of care to new providers because of burnout reduced social interaction and increased isolation limited opportunities to practice skills in community settings increased challenges in school settings Increased use of telehealth/video appointments

in-person social interactions and obligations)	
--	--

Name	Andrea Dahlberg
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep challenges ongoing (my child is 13), early gastro issues lasting until age 8, misophonia
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, ODD, misophonia, aggression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication, socialization, isolation
What additional research is needed to help address co-occurring conditions for autistic people?	More research within families, families have more insight and direct knowledge. They live with autism and the affects 24-7. The educational system needs more training and resources. Try researching where our children end up and ask yourself why? We need less research and more action. My child goes to a school for children with autism and I fight everyday to understand why they don't do more to help my child socialize within the community and/or as a typical child would. Everything is left up to the parents and if you're not an educated parent, then quite frankly you're screwed. Research why my child cannot hear or read the word quiet, see the gesture that represents that word, or listen to the sound "shhhh". Then find someone that will help me with that. That would be nice.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	It would be great to get autism services and supports. Could I get help finding a psychologist that understands autism and also have them to insurance. And I'm not talking crappy insurance, I have Cigna. Get my dental plan to cover nitrous so she can get dental work comfortably.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Heightened anxiety, increased isolation, decreased socialization
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	My daughter received school services and school related speech and OT via zoom for almost a year. Her summer program removed community activities and socialization for 3 summers. Nothing has been done to rectify all of the progress lost and the dive that my child took.

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Andrea Davis, Ph.D., DIR/Floortime Coalition of California
Demographic	Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Mental health needs of autistic people are underserved due to the great divide between developmental disabilities services and mental health systems. We recommend: 1. Social-emotional developmental models of intervention such as DIRFloortime should be core curriculum for all professionals working to provide services to autistic people in order to flexibly support people with developmental disabilities, including those with mental health challenges. 2. Professionals in the developmental disabilities field must be educated in cross-system collaboration, core mental health awareness, and mental health triage. 3. Training for mental health providers must include assessment and intervention for people with developmental disabilities, especially autism spectrum difficulties to properly serve the high percentage of clients presenting for care who are autistic. 4. Healthcare providers must be trained in identifying and treating co-occurring conditions including anxiety, depression, sleep and eating conditions, and sensory processing difficulties with non-pharmacological efforts first. While the two FDA-approved medications, risperidone and aripiprazole, may be very helpful, clinicians must be educated to use extreme care, given their significant risks of metabolic and neurological side effects. 5. Policy makers must work to integrate the divided systems for people to have smooth experiences of adequately comprehensive and accessible care for co-occurring conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Andrea Hammond
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Personal Experience: Sleep Disturbances, mainly insomnia. This makes it hard for me to enjoy life and hold down a job, and even drive. Sensory. Noise and light are my greatest struggles though I do struggle with the other senses as well. Constant exposure to noises and light cause me to have migraines and feel physically fatigued. I also struggle with motor like challenges, for example, I struggle with vertigo and balance, perceiving the distance of objects correctly, like running into walls, accidentally hitting my head on cabinets and counters, parking away from other cars because I can't tell how far they actually are, etc. This causes me to accidentally injure myself constantly or damage my car on curbs, poles, etc. if I am not very cautious. Other physical health conditions I struggle with are tinnitus and ear aches, and GERD. To my knowledge, other Autistic individuals have a high comorbidity of things like Ehlers Danlos Syndrome and POTS. I personally have not been diagnosed with these but I know of many other's who have.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Personal Experience: My greatest mental health struggles are general anxiety and social anxiety. These make it difficult for me to find community, socialize and find a job, hold down a job, or excel in a job. Autistic burnout from things like meltdowns and masking should be considered as well since it is very similar to depression. Burn out makes it extremely hard for me to care for my basic needs such as hygiene, eating, keeping my environment clean and working. It causes me to have more meltdowns often times leading to scratching myself and feelings of hopelessness. For others, it is important to note that depression is extremely prevalent in the autistic community and one of the leading causes of deaths for autistic individuals is suicide. Our average life span is significantly less than others because of this.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Personal experience: For me, communication disability is where I struggle. I am much better communicating via writing. I struggle to retain spoken instructions and struggle with Auditory Processing Disorder which makes it hard for me to understand spoken words quickly. This makes working hard as I am expected to listen and understand at a quicker pace than I am able. It affects my social life as others don't often have the patience to give me the time I need to understand, or the extra effort it takes to give written instructions.
What additional research is needed to help address co-occurring conditions for autistic people?	More research needs to be done with autistic adults of all genders and races. It is hard to find resources as an adult, but especially for women and people of color.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	My greatest struggles is finding support as an adult. Everything is geared towards children or the family of autistic individuals. Therapy is so inaccessible to me yet is something I desperately need. I haven't found a doctor who understands autism beyond stereotypes. When looking into services that might be of help to me a lot of them were inaccessible, they didn't have options like online applications. A lot of them needed phone calls or in person visits. Both of which are a huge struggle for me but also for those who are Non Verbal and the stigma we all face but especially for those with higher support needs. Autistic adults could really use more support as we are often forgotten about once we are no longer children even though we are still autistic.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I don't have much to say on this but the struggle I faced most was the reaction to parents not wanting to give their children vaccines because they feared it would cause autism, even though that has never been true. It was hard to face a world that would rather see their children sick or dead rather

	<p>than be like me. The other affect it had on me was my job. Because of my struggles I was unable to obtain a degree but work had become out of homes, but work from home jobs almost always need a degree. So I was forced to find a job that I was constantly exposed to others and at risk.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Positive impacts I had was things like social distancing and services like grocery delivery. There was also a lot less societal pressure to go out, to interact, and to touch (such as handshakes or hugs). Negative impacts would be things like a massive increase in changes surrounding things like businesses. There were rules that we had to follow but not everyone followed them, hours changed and you could no longer go later at night when less people were around (even my 24 hour gym is no longer 24 hours and closes early).</p>

Name	Andrea Webber, Mom
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	He has not lived with me in a long time but I do know that he can be up all night.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	He was self injurious a few years ago. Because I haven't seen him with short sleeves I don't know if he still is and he wouldn't answer if I asked.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities. Because there is no medication that I'm aware of to alter the mind to understand societal restrictions and laws and because there is a common denominator for people on the spectrum to not understand these laws, what can we do for them? They often appear to look and act strange. And although there is no intent for foul play; rejection, isolation and bullying can cause a meltdown because of misunderstanding. I was told by someone who works with my son that he needs to reside in a place that doesn't exist. Unless he is in a safe place, not to just protect unknowing people in the community but mostly to protect him from retribution from the community he is just being set up for failure or worse. My 43-year-old son with autism and co-occurring mental health issues was in county jail from 4/7/22 until 9/2/22 when he was moved to Ann Klein Forensic Hospital in Trenton until 10/13/23 when he was moved to Trenton Psychiatric Hospital where he remains. The optics of the police report has been misinterpreted and exaggerated, being seen outside the realm of those familiar with ASD/MH. There's so much more but I'm over my limit. The legal system needs to get on board with professionals in the field of Autism.
What additional research is needed to help address co-occurring conditions for autistic people?	It should be individualized based on the case. As Dr Steven Shore said "If you've met one person with autism, you've met one person with autism." The legal system with ASD people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Housing and different supports. The people on the spectrum that I know of don't do well in a group home or with others, granted that's only the few I know. I don't know if anyone knows what they need. I think program/housing using Jespy House as a prototype but with changes would be a good start. There is also Mt. Bethel in Warren NJ which was originally supposed to be for people that were intellectually high functioning but socially and most every other way low functioning. From what I understand as one of the original founders said they could not find enough people to fill the Mt. Bethel so it was opened for ID people.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Prior to COVID I had 2 support staff, students attending TCNJ, working with my son. One was going to have him interview at the school for food service as they had special needs people employed the other was going to have him interview at the ShopRite she worked at, all of this and then COVID lockdown. Not that I know what the outcome would be but it was close to hopefully having a chance at a job as they would have been his job coaches.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>He was already being ostracized by the community, COVID just made it that much worse. In fact that was when he started to get into more trouble being totally on his own. Also he thought COVID was just another excuse for people to treat him as bad and worse than they always have.</p>
---	--

Name	Andrew James Sanchez , Social Optics
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	To be completely honest there are quite a few. 1. Hyper photosensitivity allow sudden bright flashes of light or glare to cause me physical pain and even temporarily stun my body physically I call it the "Flashbang" affect. 2. Poor Interception and Proprioception, Random Spasms and Affects on Motor Skills. Autism has many physical effects people don't see, everything from issues which slack muscles, to the inability to sense when you need to go to the bathroom until it's too late or not sensing it at all until it's already happened. This is why many autistic youth and adults wear incontinence products / diapers some adults may have an issue with it their entire life with it worsening into adulthood. You can imagine what this does to on social life if you don't find people who accept you. One of the bigger problematic things is how it affects your ability to move through the physical aspects of executive dysfunction.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many autistic people deal with some kind of trauma disorder as a form of mental health issue. These trauma disorders can be manageable while others can be heavily debilitating due to the increased likelihood of autistic people be traumatized physically or sexually. This is how somebody who could be working through PTSD can end up with cPTSD after significant A.C.Es or Adverse Childhood Experiences when coupled with adult traumas. Age regression is also extremely common amongst autistic people along with a kind of unidentified split between what some of us describe as our neurological age which can be much much younger than our physical body and our physical age. This can cause a great deal of suffering for autistic people with that split growing if certain support needs surrounding housing, therapy, and community aren't obtained.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Two big ones can be dyscalculia, and dyslexia. Often these will manifest as a learning disability or be labeled as such, there is often developmental delay in stunting with physical manifestations of age not showing up until much later. For example we may get our teeth very late, we may go through puberty very late and when it manifests it's a bizarre situation where we'll go through it multiple times in our life. To those who aren't autistic this won't make sense Extreme difficulties with math for a major problem for autistic people with learning disabilities being extremely common many of them centered around math. This in terms creates more educational trauma in which the autistic person will become fearful of going to school. Anxiety which presents itself through increase likelihood of medical and in school trauma are also common.
What additional research is needed to help address co-occurring conditions for autistic people?	One on one interviews, preferably paid research speaking to autistic people about their understanding of the following concepts within themselves. Age and how age is perceived. Their struggles, autistic people need to be asked "what are the things you have difficulty achieving?" Many of us will answer things like "gainful employment tell her to our specific and extremely challenging condition, housing that is affordable for someone on an autistic income which is usually below the poverty line, in an understanding of food sensitivities in society. One-on-one research is vital because each autistic person and the physical and mental toll on their body is completely different. You're welcome to contact me as an advocate.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access	The biggest would be access to housing, housing that is supportive without feeling like a prison. Housing that doesn't assume that all autistic people have the same support needs which doesn't have a curfew but supports are readily available should we call and need them. The other is access to

<p>to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>mental health services that are trauma-informed and seek to help rather than punish. An autistic meltdown is not a crime, and autistic shutdown is not a moral failing. When we do not address these issues we fail not only autistic people but society as a whole.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Covid-19 was extremely dangerous for autistic people as most of us tend to have extremely sensitive immune systems and were prone to being killed by it. No one spoke about this. Many of us use places like zoos and aquariums and even some amusement parks where possible as places of vital systemic regulation and sensory regulation. This also included parks and certain businesses that brought us a sense of comfort. Covid-19 not only left many of us in undesirable situations struggling with housing but the shutdowns also endangered our mental health when the places we frequent are closed. Because autistic people have a lifespan of about 40 to 42 without support needs. Being stuck into one place, wouldn't inability to obtain certain foods our body won't reject and certain replacements for medical products and sensory items covid-19 left a lasting effect on those of us whom survived it. From mental health aspect many autistic people thought of taking their life during covid's highpoint.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Each Autistic person is different. For some autistic people like me, asking people to quarantine during covid and stay indoors unless absolutely necessary for work made for a quiet commute, free from many types of smells, loud noises and radio playing, and inconsiderate people on the subway system. For people that are hypersensitive to sound, light, and smell this was a blessing at times for me and others. Being able to go and work from home, and the Advent of hybrid education is taking society in a more inclusive direction even though people have tried to force human beings back into the cubicle, back into the hustle and bustle that degrades our mental health.</p>

Name	Andrew, Spouse of person with autism
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Of the examples listed, my spouse displays issues with her gastrointestinal system and bowel movements on a regular basis, great difficulty getting meaningful sleep due to waking up (and also frequent heartburn), has issues with sensory overstimulation (particularly noise, but also the taste and feel of certain foods). She also experiences minor issues/"klutziness" with general motor functions on a daily basis.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My spouse experiences constant anxiety over manners large and small, even worrying if I'll suddenly dislike her after 3 years of a happy marriage. She also experiences depression frequently which exacerbates her anxiety and often leads to suicidal ideation, but with no plans. My spouse also exhibits symptoms of ADHD, tho she is not diagnosed, in having an extremely hard time focusing even on activities she enjoys, inability to sit still for any period of time, and having a hard time committing to tasks around the house.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My spouse struggles with dyslexia, which has impeded her in school and even in her previous career work as a teacher. Physical books have words that are cramped and more difficult to read, so she usually utilizes audiobooks or a tablet, which has greater spacing. My spouse frequently flips words in sentences around and also has a lot of difficulty with even simple math, especially multiplication and division. My spouse struggles with some communication. She has a hard time reading and understanding social cues and sarcasm. Her thinking is also literal so I have to try avoiding metaphors or speaking around a subject.
What additional research is needed to help address co-occurring conditions for autistic people?	Finding earlier symptoms of autism in women, rather than being mistaken for symptoms of bipolar or borderline personality disorder.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I am unsure just yet as her diagnosis was recent.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The lingering threat of COVID, along with seeing loved ones who did or did not take the risk of getting COVID seriously, made it difficult for my spouse to trust certain people. Her black and white thinking makes it a challenge to empathize with family members who deliberately didn't wear masks or believed COVID was a hoax due to political or religious reasons. The distrust has lingered in COVIDs wake.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My spouse has enjoyed the reasons to stay separate from crowds of people, and it hasn't been easy getting back to "normal" with going back in public. It causes her anxiety just going to the store. She would love to find remote work after discovering the peace of mind that staying home each day afforded.

Name	Andy
Demographic	Autistic individual; Family member of an autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>When I was much younger, I struggled with insomnia. Sometimes, it would take hours for me to fall asleep. When I was about 16, I started to have the opposite problem where I could easily sleep for up to 14 hours straight. I also have sensory issues such as extreme sensitivity to sunlight, sensitivity to sound, and a strong aversion to the sensation of being wet. I also can't stand the sensation of my skin touching grass. And yes, walking in the grass with wet feet is a literal nightmare for me. In fact, just writing that sentence makes me cringe so hard that I viscerally feel the need to throw up. I always carry some kind of noise reducing/noise cancelling device with me at all times and I wear sunglasses religiously. The most difficult sensory issue to live with is my aversion to getting wet. This makes it incredibly difficult to shower, wash my face, do the dishes, wash my hands, and/or brush my teeth (my personal sensory hell). Unfortunately, I also struggle with an obsessive need to constantly rinse or wash my hands which I believe is OCD. In eighth grade, I washed my hands so often that they would crack and bleed. One of my biggest struggles, though, is my digestive system. When I was about 14, I started experiencing constipation, gas, bloating, inappetence, occasional nausea, occasional diarrhea, and all sorts of abdominal pain (dull, sharp, chronic, etc). I'm 22 now and I still deal with these symptoms almost daily (not all at once, usually 2 or 3 at a time).</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>I have a long history of self-harm, suicidality, and several mental illnesses, including but not limited to, major depression, generalized anxiety disorder, obsessive compulsive disorder, ADHD, gender dysphoria, and an eating disorder that I have struggled with off and on since I was 12 years old. As you can imagine, these all blend together with my Autism to make a hellish concoction of misery. All of these conditions have caused me so much suffering that I made the decision long ago that I will NOT be having children (at least not biologically). I don't think I could live with myself if I passed all of that [profanity redacted] onto another innocent little human knowing full well how terrible their life is going to be. On a brighter note, I am doing much better now for the most part. Don't get me wrong, I still struggle with everything I mentioned, but to a lesser extent. Additionally, this March 5th will mark 3 years since I last self-harmed. I'm still tempted to occasionally, but I also want to keep my streak going.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>There are many things that make living with Autism incredibly difficult, but the problem is NOT that I'm Autistic. The problem is the lack of patience, willingness to learn, and a severe lack of resources (at least here in the U.S.). There was a study done where researchers observed allistic participants' reactions to an Autistic person. They found that the allistics (on a scale of likability) assigned a lower rating to the Autistic participants as opposed to their allistic counterparts. This study supports the hypothesis that allistic people are more likely to dislike us rather than see us in a favorable light. Now, to be fair, the person doing the rating was not informed about who was Autistic and who wasn't. This could mean that their distaste for us occurs subconsciously. So, the hardest part about being Autistic (in my personal opinion) is how much everyone dislikes/alienates you for literally no good reason. They don't even know WHY they don't like you, they just know that they don't like you. Here is the URL address to the study: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8992906/ A lot of us Autistic folks struggle with rejection sensitivity dysphoria which basically means we can't help but take rejection VERY personally. This includes being</p>

	<p>rejected by potential employers, potential friends, family members, universities, potential romantic partners, etc. In other words, we are naturally more sensitive to rejection, yet we experience it almost everywhere we go.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Oh honey, We've only studied Autism about as much as we've studied the 7 oceans. The first "studies" done on Autism only included young, white, male participants which is obviously incredibly biased. Fun Fact: the "evaluations" that Hans Asperger performed on Autistic children were actually just a test to see if (in his imbecilic opinion) the children were "functional" enough for society. Oh, and if Hans didn't deem them "functional enough," then they were sent to a nazi "asylum" where many of them were starved and/or abused until they died. So, all the research needs to be done! Considering the fact that earlier "treatments" for Autism included electrically shocking the patient, I'd say we need to take a VERY different approach to researching Autism (and it's co-occurring conditions) in the future.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Where do I even begin? First off, getting evaluated is not feasible for the majority of Americans since it costs anywhere from \$2,000-\$6,000, and there is usually an extensive wait list. The first goal should be to make an autism evaluation more accessible for EVERYONE. Insurance usually does not cover an evaluation, and the clinics that do the evaluations usually don't take insurance. We need to make EVERY insurance plan cover an Autism evaluation since so many idiots want to argue that self-diagnosis isn't valid when it ABSOLUTELY is. Also, the actual evaluation criteria should be developed by Autistic Neuropsychologists, not Neurotypical people, like hello? Who is going to be able to accurately identify Autistic folks better than Autistic folks? Also, accommodations on the job are basically non-existent. We need to promote the normalization of disabled people using accommodations. I have had jobs in the past where customers clearly mistreated me (while I was wearing a pin which disclosed that I'm Autistic), but I couldn't stand up for myself because I know that management would NOT have supported me. A lot of us feel pressured to work without accommodations because we have been made to feel like a burden in the past. We also need to have more services that help us get hired. MANY interviewers have rejected me purely because I seem "awkward" in their opinion. Keep in mind, I'm talking about places like gas stations and Taco Bell, not fancy office positions.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I can only speak for myself, but I actually enjoyed quarantine for the most part. I know that might sound crazy, but after 18-19 years of masking, saying "I'm tired" would be a gross understatement. I loved not feeling that intense, relentless anxiety I always feel whenever I leave the house. It was also nice to not get judgmental looks from strangers all the time since I'm "odd-looking." I haven't worked a remote job, but that sounds like a literal dream come true for me, personally.</p>

Name	Andy Shih, Autism Speaks
Demographic	Representative of advocacy organization
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Constipation, celiac disease, catatonia, obesity, restricted eating and sleep disorders are just some of the health conditions that commonly affect the autistic community. Restricted feeding in particular can lead to more medical issues, specifically lower bone density causing concern for osteoporosis. Often, the symptoms of physical co-occurring conditions can lead to diagnostic overshadowing, a clinical error wherein physical symptoms are misattributed to autism, leading to inadequate treatment. Sensory sensitivities further complicate matters, as they can alter the expression of physical symptoms and pain, making diagnosis and treatment for co-occurring conditions more challenging. Autistic people may also experience medication sensitivities, further complicating treatment plans. Health disparities in autism, coupled with increased risk for conditions like epilepsy and GI disorders, underscore the need for timely and appropriate medical intervention. Failure to address physical health conditions can lead to early morbidity and mortality. But accessing care remains a challenge for many. Addressing complex needs requires a team of specialized physicians who understand autism and can provide a level of care that is inaccessible to many autistic people, particularly in underserved communities. Many are forced to seek care in the ER, where staff often lack the necessary expertise to serve autistic patients.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Co-occurring mental health conditions can lead to difficulty with work, school, community engagement, employment, post-secondary education and potentially run-ins with the justice system, greatly affecting quality of life. Limited evidence-based psychological interventions and stigma surrounding mental health exacerbate the difficulty of managing conditions like ADHD, anxiety, OCD and aggression. Moreover, treatment for these conditions often requires significant social interaction in settings that may be overwhelming for autistic individuals (e.g., hospitals), presenting additional barriers. Oftentimes, autistic adults in healthcare settings struggle to communicate their experiences, leaving them feeling misunderstood and unheard. Access to appropriate care and in-patient treatment facilities remains inadequate, particularly for autistic adults, increasing the burden on autistic individuals and their families. Non-specialist providers are not trained in autism, resulting in a lack of providers across specialties who are aware of the unique needs of the autistic community. Particularly in cases where an autistic person is experiencing severe aggression or self-injurious behavior, lack of adequate care can have a significant impact on their and their family members' quality of life. Family members may experience threats to their physical safety, mental health issues and lowered community participation.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>When these conditions co-occur with autism, differential diagnosis can be particularly challenging due to overlapping symptoms. Additionally, addressing the needs of autistic individuals with intellectual or communication disabilities poses unique difficulties, as understanding and responding to these needs can require specialized knowledge and accommodations. Unfortunately, many autistic individuals have limited access to specialized care, hindering timely intervention and support. Co-occurring intellectual, developmental or communication disabilities can also cause challenges in school, employment, post-secondary education, and community programs. Tailoring educational plans to accommodate diverse</p>

	needs requires specialized expertise and resources often lacking in schools and community programs.
What additional research is needed to help address co-occurring conditions for autistic people?	Addressing co-occurring conditions in autism requires research focused on the real-world effectiveness of interventions outside of controlled laboratory settings. Research should also prioritize understanding the social determinants of health, quality-of-life indicators, and predictors of community integration to better inform community-based support strategies. Research on co-occurring conditions like anxiety, ADHD, catatonia, and irritability is also needed, as well as research into validated treatments for these conditions and methods for disseminating these best practices to community providers who feel ill-equipped to treat individuals with ASD. Aging-related research is crucial for understanding the evolving needs of autistic individuals over time. Finally, there is a pressing need for research on behavioral interventions tailored for adults with autism. All this research needs to be codesigned alongside autistic people and their families and prioritize enrolling a sample of diverse populations.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Improving services and supports for co-occurring conditions in autism will require capacity development across all specialist levels, from peer supports to highly specialized professionals. Increased reimbursement for primary care providers and specialists caring for autistic individuals may allow for greater accommodations and increased staffing in these fields. The priority should be to improve access to qualified healthcare providers who feel comfortable treating co-occurring ASD and mental and physical health conditions. A multi-disciplinary approach to care where healthcare professionals coordinate with one another to support an autistic person's needs is also essential, particularly in complex cases. Many autistic people wait for years on waitlists to access care, so expanding insurance coverage to include group interventions would greatly increase access to care and support services. Expanding access to community integration opportunities can also enhance the overall well-being and quality of life for autistic individuals. To accomplish this, it's necessary to increase staffing for respite care providers, adult care programs and other supports, and improve training for these service providers.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The COVID-19 pandemic has had a significant and ongoing impact on the autistic community. Many autistic people have family members and/or caregivers who have experienced death, disability or long COVID symptoms, affecting their ability to provide care. Many are struggling with decreased availability of support personnel (e.g., therapist, respite, school staff) due to illness. Fear of infection has also exacerbated anxiety and stress, particularly for those with co-occurring mental health conditions. This often results in lack of service utilization, decreased social connections and increased emotional distress. In children, disruptions in school routines have led to potential regression and loss of skills in children. Across the Autism Speaks Autism Care Network, some clinicians have observed abrupt worsening of behavior following COVID infection (e.g., sudden increase in OCD type behaviors).
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	The societal changes brought about by the pandemic have had both positive and negative impacts on the physical and mental health of autistic individuals. The widespread acceptance and use of telehealth has increased access to care and support services. Similarly, the flexibility of remote work and tele-education have provided new opportunities for individuals with autism. However, for many, increased social isolation and reduced in-person interactions have negatively impacted mental health, leading to

increased use of telehealth, reduced in-person social interactions and obligations)	regression of skills in some individuals and heightened anxiety and stress for both autistic individuals and their caregivers. Service disruptions and staffing shortages for treatment personnel have also directly impacted quality of life for many people.
---	--

Name	Angela Close, Parent of adult with ASD
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Obesity due to lack of activity, social engagement, and sensory issues. Partially addressed during school years with PE and Unified Sports programs. Need additional programs to promote life long physical fitness. Hiking, biking, swimming, pickleball groups for adults with ASD.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is most problematic for my son. Processing news, media, health issues and even weather can be anxiety inducing.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning differently!! It saddens me that we barely capture their potential because we can't seem to put enough resources to teaching and training differently. My son learned to read early with musical videos. But this method is not available in other areas.
What additional research is needed to help address co-occurring conditions for autistic people?	We need to research what the physical health implications are for ASD. Are gyms and fitness centers ASD friendly? Are their classes and programs. What educational and vocational teaching aides can we create for better learning.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Transportation to access services. Many adults with ASD do not drive and public transportation is limiting. It limits their availability to health care, counseling, social programs and employment. Too many unemployed or underemployed!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I can't imagine what it was like for those fearing vaccinations. My son overcame his fear of vaccinations just in time. Luckily his sensory issues did not prevent the use of masks. The anxiety must have been tremendous. The long COVID must be worse amongst the ASD population.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My son's internship with the local hospital was delayed, but they were able to train in a food bank and hotel instead. Eventually they had access to the hospital program with all the necessary vaccinations and precautions. As caregivers we had to be extremely cautious not to contract COVID. Our lives were greatly impacted, minimizing social interaction to remain healthy. Parents of ASD children cannot get sick. We have few options in caring for our children.

Name	Angela Hilbert
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders. It's not just an upset stomach. Crohns' disease, in particular is a serious auto-immune disorder that shortens one's lifespan and puts them at high risk for cancer. I am autistic, my daughter is autistic as well. My daughter has had 2 surgeries for Crohns and has also had cancer twice. She is only 36. My own greatest struggle is the sensory problem of coping with light and noise. I am a high-masking autistic person but too much noise, light, or garish color can rob me of my ability to mask or even speak. Bright, noisy public environments are not accessible to me unless I can prepare to navigate them and allow recovery time after.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am Autistic and have ADHD and Anxiety. It took me 12 years and 5 schools to complete my bachelors degree. I've been suicidal every time I've been through a burnout. When I meltdow, I beat my hands against tables, desks, door jams, and peel my own skin off my arms. This happens when I have deferred my own needs to accommodate the neurotypical people around me for too long at my own expense. Neurotypical people will not allow you to participate in society unless you can successfully pretend you are not autistic around them. You have to pretend light and sound doesn't hurt, that you don't need to rock. That you are "trustworthy" enough to make just the right amount of eye contact (even though eye contact feels like physical touch to you.) You have to translate everything through your best neurotypical lens or they won't understand you, you have to clarify the meaning of their raised eyebrow, the mis-match between their words and body language, monitor your face to be sure what your own facial expression is communicating is congruent with your intention for them. All this is in addition to the ordinary stress of everyday professional life. It's exhausting and when the mask inevitably slips, you are shamed, shunned, and excluded. This kind of hypervigilance is deeply unhealthy, but fundamentally necessary to participate in society as an Autistic person. And it is deadly.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I am fortunate that I do not have co-occurring intellectual disabilities. While my natural communication is "Autistic" I have studied communication obsessively to be able to "speak" the neurotypical language. I have a second degree in communications. I consider this essential to my ability to communicate professionally. I always have to go the extra mile to communicate with neurotypical people because they are too inflexible and self-centered to meet me half way and learn my language. Autistic people do not have a social communication disability. They just socialize and communicate differently. Autistic people communicate perfectly well among one another, just like neurotypical people do. But because neurotypical people are the dominant culture, they force Autistic people to do all the code-switching. (and they have the nerve to say WE are the "inflexible" ones?!) Autistic people HAVE to accommodate neurotypical social and language norms and be empathetic enough to recognize them. Meanwhile, neurotypical people are remarkably obtuse about recognizing Autistic communication and empathizing with Autistic people.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on the double-empathy problem and Monotropism Research on Diversity, Equity and Inclusion programs that work for making professional settings more accessible and safe for Autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic	Do people with ADHD really have to see their doctor monthly for a non-renewable prescription of basic ADHD medication? I live in a rural area and have a 56 minute drive to my psychiatrist's office. I miss half a day of work

<p>people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>every month for this. I use up all my PTO just to keep medicated and in command of my own executive functioning. If I have to miss that appointment for an important work issue, I don't get my meds and have to work scattered. It reflects on my job performance and how I am judged and evaluated. If I use up all my PTO just managing my basic medication requirements, I don't have any for "mental health days", or a vacation to recover from chronic overstimulation and masking. This leads to burn out and job loss. I can't win. If I opt for using FMLA I have to disclose my Autism which can be career suicide. Even in a place where that would be safe, I would still have to take half-day without pay every month to use FMLA. It puts people with Anxiety and ADHD in an impossible situation.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I LOVED IT! Shut downs were awesome! No pressure to socialize or meet for lunch. I've been working from home for the past 15 years, but for many of us, working at home meant we were finally able to control our own sensory environment at work for the first time! It created an increase in digital and written communication, which is a much more level professional playing field. Closed captions assisted those of us with auditory processing problems in meetings. I could flap my hands and rock my chair all day without looking "unprofessional." Even now, that shut downs are a thing of the past, I still have things like being able to order my groceries and just pick them up instead of wasting my saturday in the loud, chaotic market. Covid also brought to light how much EVERYONE's mental health was suffering at work. A new focus on the importance of mental well-being in the workplace is a tide that lifts all ships.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>see my previous entry. But Covid showed society that their addiction to in-person work and social structure was just an un-necessary preference, not a vital need. We can work, shop, meet, learn, play, and engage in so many more ways. Covid changed society to be more inclusive of a wider range of engagement methods and strategies.</p>

Name	Angela, Autism caused from brain damage at birth.
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Just some of my everyday personal physical health challenges: Sleep Issues, Sensory Issues (Sound and Touch), Speech Issues, ect.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have been informed I have ADHD, PTSD, Depression, Anxiety, and OCD Tendencies.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Math and Reading are given issues when dealing with Autism, but the hardest part of being Autistic for me is communication. It always feels like I am trying to translate a foreign language into another language without ever even knowing the original language.
What additional research is needed to help address co-occurring conditions for autistic people?	More research is need on Communication and speech therapy for Autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	We need more person to person options. A lot of my Autistic friends have issues when dealing with strangers/people on the phone. This is how their social anxiety show themselves.

Name	Angeline Low, Apt Fitness, Inc.
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have ADHD, SMDD, PTSD, OCD, GAD, and other chronic mental and physical health conditions. I only sleep 0-90 minutes daily, which greatly inhibits my cognitive window, my body's rest and digest, and resetting my system through restorative sleep. There are many foods I cannot tolerate either due to anaphylaxis or texture / taste, which impacts my diet and weight. People often yell at me to stop stimming, which increases anxiety and depression. I am hyper flexible / hyper mobile, which impacts my stationary stability and agility.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I cannot sustain employment. I cannot retain relationships. I cannot assimilate. I wish I was dead, but I am not suicidal. Each morning is a struggle to get out of bed and face the world. It is too overwhelming. I miss a lot of work and get fired for it. Without a way to pay bills, I sink deeper into depression and anxiety.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have difficulties reading and retaining what is read. I cannot understand people outside of a certain IQ range, because they seem illogical. It is a struggle to mask, and exhausting, because everyone expects me to be "normal," but I am different. Intellectually it is a challenge to communicate with others as they do not process their environments through logic, reason, critical and analytical thinking, and factual basis. I feel alone and struggle in school even as an adult. My social anxiety is so bad, I have a form of anxiety induced mutism, alexithymia, mobius syndrome, and people often misunderstand me.
What additional research is needed to help address co-occurring conditions for autistic people?	More awareness must be raised. People need to stop believing "everyone has a little autism." The condition needs awareness not desensitization. More research must be conducted on the links of autism and other conditions both mental and physical. Employers need to be more sensitive to the needs of autists as we are excellent employees when we are able to focus on performance.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to autism related services. I founded Apt Fitness, Inc., to help disadvantaged individuals affected by autism and ADHD, so they could afford to learn coping strategies, fitness, and social skills. We need more focus on nonprofit organizations such as Apt Fitness, Inc., which provides outreach support and services. When people are diagnosed late, they have missed a majority of their lives, where they kept thinking they were the problem, that something was wrong with them, when they were only autistic and needed to be shown coping strategies.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I have had long COVID-19 for two years, and it has exacerbated both my Autism, ADHD, as well as depression, weight, anxiety, and all of my other issues. Chronic fatigue, insomnia, my brain will not calm to sleep. I can go for 30 days without sleep, but my body is tired. I then start crying, curled in a ball, wishing I was dead, because I'm so exhausted and want to sleep but cannot fall asleep or stay asleep.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Telehealth is a positive. I was unable to go to the gym during COVID-19 and now cannot return due to long COVID. I am returning to school for a graduate program, but my attention span is nonexistent. I cannot sit still and continually fidget. I cannot concentrate at work. Increased remote services

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	are a bonus, but some employers do not believe in remote, even during the pandemic they operated fully staffed in person.
---	---

Name	Angie Gorz
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances, sensory motor challenges and trouble addressing them due to housing inequity and noise pollution, and epilepsy.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, obsessive compulsive disorder, mood disorder NOS
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disorder, intellectual disability, developmental disability, movement disorders, mobility disorders.
What additional research is needed to help address co-occurring conditions for autistic people?	What is needed is actual support, not research into cures. Autistic adults and families need support. People who don't have multiple diagnoses need access to counseling, not constant denials.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to mental health counseling for everyone, training in med to avoid patients being treated poorly, equitable access to all care, access to leisure activities to those who have co-occurring diagnoses, and more.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	More depression, increase in anxiety, increase in obsessive thoughts, decrease in happiness, increase in sleep disturbance,
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Reduced in person interactions because no one takes covid seriously

Name	Ann
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Overstimulation causes me to be very tense and in physical pain. Very sparse sleeping hyper mobility and joint issues. Can not stand for very long
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety Depression Suicidality Chaotic substance use as a way to cope
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Often I shut down and am unable to speak, especially when confronted by a police officer. Communication Delays make simple tasks such as paying for groceries difficult for both of us.
What additional research is needed to help address co-occurring conditions for autistic people?	Research how to support the Autistic community, especially in the areas of the medical industry, and law enforcement industry. These are the two industries that I struggle the most with.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Diagnosis availability for adults. many of us were overlooked as children.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Extream impact. I experienced 3 covid infections even with vaccines, because the timing of vaccine availability left gaps of exposure I am unemployable now because of my poor physical health and Autism but do not qualify for disability
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Isolation from support Hard to breath and move More sensitive to the environment than before

Name	Ann Glynn
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	For our son sleep disturbances and sensory challenges have been a constant.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	at the age of 13-14 our son's aggression toward others and self injury was off the charts. Even with intense interventions, behavior therapy and medications the challenges still exist. His behavior can be very unpredictable and stressful for himself and those around him. While he is learning to self-regulate (will be 20 in July) and we as his family are very in tune with his cues and triggers it has been in our experience one of the most challenging parts of his autism. There needs to be more awareness and help for families.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Our son is biologically 19, almost 20 however with his significant developmental delays he is more on the level of a 6-7 year old. He is not always aware of the dangers around him and needs constant supervision. He is a wonderful young man but this does present many challenges for day to day life.
What additional research is needed to help address co-occurring conditions for autistic people?	I would love to see more research on the sensory implications and how the mind is processing the world around the autistic individual. I feel if we could get a better understanding of how the individual was feeling in the world around them it would give us a better understanding of understanding what may be the root cause of some of the extreme behaviors that many of these individuals face on a day to day basis.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Now having an adult child with autism there needs to be life long support available for these individuals. Many if not all the services in most areas drop off when the person ages out at 21 or 22. Many will still need support for the remainder of their life. While they may not be able to go on to work they can lead a very full life with the right services in place for them to continue to teach them life skills and coping skills. Many family members need this to be available as it is devastating when there child ages out to go from a very detailed, routine schedule to days filled with nothing. There also needs to be more training and guidance for parents & caregivers.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	That was extremely hard for our son who thrives on routine and in the span of moments their life changed with no alternatives available to fill their lack of routine. My son went from school, aba, speech, ot, special needs swimming & adaptive tennis and golf to nothing available at all. Not even being able to go in many places comfortably. It truly left many families with a void and scrambling with how to create a new routine that would help their child process the world around them. Also when the world switched to virtual learning it was a literal joke for my son. The support wasn't there to keep him engaged and as a parent it seemed as though most of these individuals fell through the cracks.

Name	Ann Titus
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological Demand Avoidance, also known as Persistent Drive for Autonomy
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Loneliness -- difficulty making friends
What additional research is needed to help address co-occurring conditions for autistic people?	Not only are the mental health care system and schools failing autistic people, but society as a whole doesn't value neurodiversity more generally. So, how can non-autistic people do a better job at accepting those who are different into their lives, places of work, etc.? Also, what information is being given to parents who have just learned their child is autistic? Why is ABA the go-to therapy when so many adult autistic people report that it is abusive and traumatizing? How can mental health professionals who diagnose autism better serve parents, and provide more appropriate resources? Are some "early interventions" actually harmful, especially to PDA autistics? Why isn't PDA in the DSM?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Most providers are unaware of Pathological Demand Avoidance and therefore give poor advice. Therapies can be counter-productive. Also, if a child is diagnosed with autism, he/she/they should automatically be offered an Individual Education Plan. There should be no question or assertion that a child doesn't have "educational autism." Schools should be resourced adequately, so that they don't reserve IEPs for the toughest cases only.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It's been devastating. Screen addiction, weigh gain/obesity, lack of friends, a disruption in my child's routine and sense of security and well-being. And when kids suffer, parents suffer.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	All of the above. Disruptions have negatively affected every aspect of life. Remote work and remote school simultaneously was impossible. Mental health suffered enormously. Reduced activities, reduced interactions. On a positive note, Telehealth was a major bright spot! We continue to use Telehealth to access care with our son's neurologist, and we were able to get parent coaching through Telehealth that we wouldn't have been able to do otherwise, with our busy work schedules.

in-person social interactions and obligations)	
--	--

Name	Ann, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Inability to communicate results in aggressive behaviors and undiagnosed medical conditions.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Training group home staff to be understand these conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Really?! How would you feel if you were unable to speak?
What additional research is needed to help address co-occurring conditions for autistic people?	More emphasis on severe autism. Research on organic causes of speech apraxia. "Speech therapy" is ineffective.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Liaisons in emergency rooms to help parents overcome the implicit biases by doctors in understanding autism. Appropriate long-term housing for people with severe autism who are unable to communicate and left isolated and defenseless to protect themselves against abusive staff. Until appropriate housing is available people with severe autism need video monitoring for protection.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Covid19 isolated people living in group homes from their families. Please pass the Essential Caregivers Act.

Name	Anne Cuvellier, MSW
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I work at two jobs with children, adolescents and young adults diagnosed with Autism. One a school that requires a diagnosis of Autism and the students also have extreme behaviors and clinically at an inner city clinic providing individual and family therapy to persons diagnosed with Autism. Physical issues related to sleep, gastrointestinal and seizures seem pronounced but certainly sensory issues are present with many. Challenges encountered by the individuals that I work with are most times related to an interference in the individual's ability to socialize (sensory and communication), engage with others (communication, social skills), maintain emotional control (sleep, communication, coping skills). Judgement within the community is prevalent related to repeated behaviors/self-stimulatory and self-soothing behaviors which often are age-inappropriate and inability to self-regulate in the community. Sleep is significant in supporting self-regulation but seems challenging to treat. Gastro issues are often managed with diet and medication but put demands on families financially and to maintain consistency. Seizures seem common among those with whom I work but most respond favorably to treatment with medication but place stress on families. Most sensory and motor issues are treatable but finding replacement behaviors is difficult, coping strategies require CBT training and treatment and with non-verbal persons, this is more challenging.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD seems to be utilized as a diagnosis with little regard for the primary diagnosis of Autism and the overlap with criteria in these areas. Depression is more frequent but difficult to actually diagnosis if the person is non-verbal or withdrawing as a symptom of depression vs. autism. Isolation due to limited social interactions and limited ability to develop friendships/relationships contributes significantly. Aggression and self-injury are pronounced among person I see in the school and clinical setting. Self-injury - biting hand, head banging. Poor communication skills, impulsivity, intolerance of discomfort and lack of coping skills are often the cause. Suicidality is not seen in my practices.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Persons diagnosed with Autism who have higher cognitive functioning even when they are academically and vocationally delayed have more opportunities however, the challenges related to social functioning can interfere both with success at a job and with building relationships. Education is mandated to provide educational opportunities for people with disabilities but resources in the community based programs are often lacking, particularly with the many states now experiencing teach shortages, it is predictable that the students with intellectual disability will suffer from this. Communication is HUGE. Persons diagnosed with Autism are limited by the pervasive communication deficits that they experience. While technology is becoming an increasingly more important and useful tool, many times, persons with cognitive limitations are challenged to effectively and efficiently operate their devices. Being unable to communicate feelings, wants, needs, desires, in my opinion contributes significantly to behavioral challenges and is a major impediment to independent living.
What additional research is needed to help address co-occurring conditions for autistic people?	To have persons with Autism viewed as everyone else - a contributing member of society if they choose to do so. It is unfortunate to me that while schools are mandated to provide needed educational services, often at a significant cost, State Agencies that are SUPPOSED to provide adult services are not entitlements. By Departments of Developmental Services (in CT it is a 14 year wait for services under the Autism Waiver) lacking funding,

	<p>resources, organization and programs, many persons who enter their post-graduate life are left with no services, inadequate services and forced to continue to live with their parents/family members as though they have no right to an adult life. I liken this practice of mandating services until 21 or 22 through the education system and dropping the entitlement for continued services at age 21 or 22 to teaching someone to read and then taking away their books. There is no way for a student moving into their young adult life to maintain and gain skills without MANDATED programming in adulthood and without being provided the dignity of adulthood by the opportunity of living independently from family. Lastly, the current system requires that those individuals who are living with their family and require care, continue to live with family despite the age of the caregivers, this too is inhumane for both the caregiver and the person with Autism.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>funding Adult services is essential to improving the quality of life for persons diagnosed with autism. researching and developing specialized models for treating individuals with Autism to help address their mental health issues without solely relying on medication to manage mental health. providers should be required to have a specific certification in working with persons with Autism because as someone who has been practicing in the field for years, there are many unqualified providers out there and agencies who send them out. Insurance is good to my client base.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I want to comment that it is unclear beyond that I think the families and the person with Autism in many cases have increased isolation wanting only in-home services and not wanting to go to a provider as well as preferring telehealth appointments. There is a place for both of these services with all persons in need but for some aspects of the population, what serves others well, does not always ultimately help everyone. Remote learning, I am confident is saying, did not serve most of those I work with well. For a variety of reasons: talking to a screen, inattentive due to lack of interpersonal exchange, confusion re: game vs. school, confusion re learning environment home vs. actual classroom, learning deficits/lack of progress and/ or regression most likely occurred during COVID</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Isolation, depression, anxiety all appear to have increased. While some contend that telehealth and remote learning prevented a disruption in services, minimally it caused a difference in services that has never returned to pre-COVID. As mentioned, requests for in-home services/telehealth continue which promotes isolation and is frequently driven by anxiety and fueled by depression. Anxiety related to fear of contamination/illness which has compounded existing concerns about navigating the social environments of the community depending on the severity of the person with Autism's social judgement. Socialization is critical for all humans and COVID has markedly changed our patterns of socialization. I go into homes now because clients won't come to the clinic. Many only leave the home for school and an occasional outing. In many ways, this is not solely an issue regarding the person with Autism but more a statement about how culture in general is more isolated.</p>

Name	Anne Marie Price
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep..sensory sensitivities, stomach issues and joint issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety disorders. Depression.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities.
What additional research is needed to help address co-occurring conditions for autistic people?	RESEARCH AUTISTIC WOMEN.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Late diagnosis therapists and doctors who understand the difference in women autists and men. Insurance coverage. ADULT ANYTHING SERVICES.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Anne Nagel
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenge is that many healthcare providers focus on my autism and downplay any other medical condition. By attributing everything to my autism, other medical conditions get worse. Sensory dysregulation is the biggest thing. My old doctor attributed increased sensory issues to my autism. I got a new doctor who did a cheap blood test and found a bigger physical issue that had nothing to do with autism. I wasted two years of my life dealing with a problem that was solved by a cheap medication because my old doctor only saw my autism.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Annettr
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges, sleep disturbances
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, attention deficit hyperactivity disorder. Meltdowns
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Service accessibility, more services and teacher education in the school setting,
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Terrific impact- all negative. Magnified existing anxiety, My grandson was 18 months at beginning of Covid. Isolation definitely hindered his social awareness,
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Anonymous, public schools
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	picky eaters Sensory challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety Loneliness
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication Disabilities Learning Disabilities Social challenges
What additional research is needed to help address co-occurring conditions for autistic people?	Basic understanding of frequency of co-occurring conditions
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Community Education
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I think it is too soon to say how long lasting the impact will be. At the present time, I think emotional regulation, learning delays and struggles with social interactions are still be impacted for many.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Tele-instruction and tele-health are both positive and negative. Depends on the individual. Disruption in services during critical learning windows is a negative impact. Reduced community interactions results in less practice in social exchanges and less opportunity to learn about your sensory reactions and adaptations to a variety of settings.

Name	Anthony
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I struggle with sleeping consistently and find myself in a complete sensory overload state when around other people
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Suicidality is a normal part of life in a way that isn't threatening. Self-injurious behavior for me consists of nail biting and scratching to my previous injuries
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have dyslexia and in general have a hard time with social interaction and with normal conversation
What additional research is needed to help address co-occurring conditions for autistic people?	I think that a better understanding of autistic burnout specifically will be beneficial for others who are high functioning like myself
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Covid made it easier for us to isolate and not be questioned by society around us
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think that the examples all have implications both positive and negative. The big change that is a relief is that the social contract of physical contact(handshakes and hugs)

Name	Arianna C
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	It is very common for autistic people to have issues with our joints and stomachs. Gastrointestinal diseases as well as Ehlers-Danlos, scoliosis, and hypermobility are common.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Disorders associated with trauma. In my opinion as an autistic person, being autistic in and of itself is traumatic and can explain the link between autism and trauma disorders.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	ADHD is one of the most common disorders that is diagnosed alongside autism
What additional research is needed to help address co-occurring conditions for autistic people?	The link between connective tissue and autism, improving education for autistic and neurodivergent students, lgbt+ identities and autism, the digestive tracts of autistic people, autistic eyes and ears.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Make more of them
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Ariel Taylor
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disorders and sensory needs
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, a sense of loneliness
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Developmental disabilities and learning disabilities that are overlooked because everyone is just ascribed to the autism
What additional research is needed to help address co-occurring conditions for autistic people?	We need to start differentiating between autism and FASD. The most recent research shows that FASD happens at a much higher rate than autism but people with FASD are often diagnosed as autistic because of stigma/autism being more widely accepted
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Providers who take a neurodivergent acceptance approach to treatment instead of a medical model. Providers who accept Medicaid. Providers who are specifically trained in the most recent modalities for autism and not just ABA
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Longer waiting lists and services being interrupted by providers leaving and not being able to find replacements

Name	Arushie Nugapitiya
Demographic	Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The issue is not so much co-occurring conditions that you list it is the coexisting conditions (lack of a better term) like DD and mental health that create a disparity for the DD population to receive Mental Health services that create barriers
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation. Limited to zero mental health and medical service access for the DD population
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The individual support was not available

Name	Ash Keen
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Autism impacts my interoception making it difficult to sort out what I am experiencing in my body. It also impacts communication which makes it hard to communicate with my doctors
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	It's hard to find mental health providers who are trained and comfortable working with autistic adults
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For me it's my physical disabilities and how my autism makes it harder to get diagnosis and treatment
What additional research is needed to help address co-occurring conditions for autistic people?	Research links between autism and conditions like OCD, POTS, EDS, and migraines
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Providers need more training on how to interact with autistic individuals. Autistic patients could benefit from a social worker or other support person to help them navigate the healthcare system
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I don't know
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote work and telehealth appointments make employment and healthcare much more accessible for some autistic people

Name	Ashleigh
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	For me the biggest issue is whilst we are more likely to have these conditions e.g: epilepsy, the doctors who are more likely to deal with those kinds of things don't understand how autism works.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Same as last one but also there isn't information out there for autistic people to know how these conditions present in us or if it's just one of our autism traits being extra full on.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Ashley
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges, focus and attention, pica, sleep issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self injuring Stims. Eating non good items
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication
What additional research is needed to help address co-occurring conditions for autistic people?	A lot!!!! We need an understanding of the mental health needs of au people
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Not having to fight insurance for therapies, cutting down on the 15 yr wait list for ssi
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Tons! Virtual.therapy and one on one aba therapy do.not.work over video
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Ashley Bayles, Autistic Person
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Need for accommodations and compassion from allistic people.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Trying to push yourself past your limits in an attempt to meet unreasonable expectations from allistics and being unkind to yourself when you fail to meet those expectations.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Accessing community life. Autistics with additional disabilities, especially in cognition or communication, are often shunned by their peers and community.
What additional research is needed to help address co-occurring conditions for autistic people?	Research into the biases and behaviors of allistics when they are interacting or interfacing with autistics and how to mitigate/reduce the harm caused by allistics against autistics.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Provider education that humanizes autistic people and the cessation of attempts to eradicate natural autistic behaviors/ways of being.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Many of us are afraid to leave home for fear of becoming more disabled through COVID infection and post viral illnesses. We struggle to trust our communities/peers because we know they consider us an acceptable loss and will do nothing to try to protect us.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote work and telehealth have made things much more accessible for autistics. But lack of clear guidance and rules and education regarding the seriousness of COVID has made it difficult to know what is and isn't safe or reasonable to ask of people.

Name	Ashley Daly
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Finding doctors who are familiar with autism and not just focused on their one expertise. Going to and through appointments, procedures and medication with an autistic individual who needs routine, familiarity and doesn't like unknown experiences.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Autistic son already feels "different" and has trouble emotionally regulating, so anxiety is overwhelming. When looking at medication to address anxiety and depression you have to consider possible other medications being taken and hard to navigate effectiveness if individual has a hard time expressing feelings.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Additional frustrations causing emotional dysregulation.
What additional research is needed to help address co-occurring conditions for autistic people?	If you're autistic, what additional testing should be automatically considered. Public school knowledge on what else to test for and funding to do so. Schools will only test for what you argue and push for them to test for.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Training and information for parents. More knowledge and training for pediatricians on what doctors to refer out to. Providers who take insurance and do the breadth of neurodivergence testing - dyslexia, speech, adhd, etc - we paid out of pocket for a full evaluation.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Delay in testing during height of Covid/2020. Most of the neurodivergent testing needed to be done in person - Dyslexia, for example.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	A positive is increased telehealth.

Name	Audra Olazabal
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Helping people understand the interrelated dynamics between their symptoms and experiences. Help provide effective and sustainable improvements/outcomes.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of providers, lack of education/awareness among existing providers, lack of funding for supports. Many people are under-served and greatly in need of targeted and knowledgeable support.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The invisible disabilities aspect. The general public assumes the average person is capable of a lot. Many of these challenges are cognitive and abstract/soft skills that people are just expected to be able to do. It's hard to accommodate when you're unaware and when the person may themselves not be able to inform you. Requires observation and thoughtfulness from caregivers and others in one's life.
What additional research is needed to help address co-occurring conditions for autistic people?	I'd like to see more research on mental health and autism, on women who are autistic, on parents who are autistic, on gender identity and sexuality, on undiagnosed or self-diagnosed adults, on supports and services for autistic populations from teenagers through old age (i.e. beyond early intervention), on what service providers (medical staff, emergency responders, educators) are seeing, and needing, and how to best support and train them, on developmental/play based approaches, etc.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above. Training for first responders, support workers and families. Mental health and community building resources.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Audrey
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	It is most challenging to deal with the mental toll of trying to exist in a world catered to allistics people and extremely hostile to autistic people. It's extremely hard to keep a work life balance that does not immediately drain all of my mental and emotional resources but allows me to provide for myself and my household. The exhaustion is the worst part, which leads to depression and anxiety about keeping up with the demands of life
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I struggle the most with communication "disabilities", however I would argue that my communication gets misconstrued but allistics people trying to read more into what I am saying than what is actually being said, yet I'm the one who "struggles with communicating effectively" despite saying EXACTLY what I mean, and nothing more or less
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote work has done more for my mental health than therapy ever could!! Being able to stay in my safe safe, surrounded by comfort items and with support people has been MONUMENTAL in allowing me to find a day to day equilibrium with fewer meltdowns and fewer sensory interruptions. Venue caps on attendance are fantastic to make sure things will not be overly crowded and I know how many people to prepare to be around!!

Name	Aurora
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Some of the most significant challenges caused by co-occurring health conditions in autistic people includes gastrointestinal disorders such as IBS (Irritable Bowel Syndrome), issues with chronic musculoskeletal pain, and disordered sleeping, like insomnia and narcolepsy.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenges caused by co-occurring mental health conditions in autistic people are depression, disordered attachment styles, Obsessive-Compulsive disorder, personality disorders (especially borderline and schizotypal). It's very common for autistic people assigned female at birth to develop a borderline personality disorder in response to the trauma of being raised as a woman in a household with a narcissistic individual. The connection between autistic people and narcissistic abuse needs to be explored in more depth.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenges caused by other conditions that co-occur with autism is the socialization aspect of it. This is to say, autistic people tend to feel very alone in the world, and many of their symptoms contribute to this being the case. Not being adept at socialization leads to numerous problems in spaces where social interactions are required, such as school settings or work settings, which leads to potentially fatal burnout.
What additional research is needed to help address co-occurring conditions for autistic people?	The connection between personality disorders (especially but not limited to borderline and schizotypal), gender dysphoria, and dyslexia with autism needs to be explored.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Many autistic people are not diagnosed with autism because of the many barriers involved in seeking healthcare, finding a care provider willing to diagnose you, autistic tests often being made for children, or made without masking in consideration. Adult autism needs more attention, especially services designed to help adults with autism navigate the complicated healthcare system and get diagnosed with autism, and if needed apply for disability services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Autism high functioning, with Heds
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have severe GI track issues which cause severe pain and can cause me to be bed ridden by Dr orders. Along with getting too much sensory input causing me to get overwhelmed very easily when in public places.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I've severe anxiety and depression since I was a young child, due to not knowing how to cope with over stimulation and social constructs that can be hard for me to understand or know what's expected.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For me it's communication and social stimuli; holding basic conversations is very challenging for me. Plus I get very overwhelmed by the amount of info when in social settings.
What additional research is needed to help address co-occurring conditions for autistic people?	I have HEDS, GI track issues, and possibly peds. I've been in constant pain since elementary possibly sooner. Numerous joint and muscle problems along with losing vision etc...
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Having it de stigmatized so that autistic can feel comfortable getting help with mental difficulties and health issues, without being dismissed by medical professionals.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Mental health and struggle with depression and re entering society
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	It being more social acceptable and the online resources to help with coping mechanisms

Name	Autism New Jersey
Demographic	Representative of advocacy organization
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Many individuals with ASD must grapple with increased prevalence of co-occurring medical conditions but experience more unmet health needs. Some cannot find a provider to care for them or they report lower satisfaction with healthcare provider interactions. Their healthcare costs are higher, and their outcomes poorer. There are many challenges to diagnosing/treating medical conditions in ASD patients. Without formal training to treat ASD patients, healthcare providers struggle to effectively provide even basic ASD-friendly care, let alone diagnose/treat co-occurring conditions. Communication differences make it difficult for many ASD individuals to give information vital to diagnosis/treatment. ASD patients without speech may be unable to express internal states/pain or may be unable to use nuanced language to accurately describe symptoms. ASD individuals without speech may express pain behaviorally and potential medical causes for challenging behaviors are commonly overlooked. ASD patients may also receive substandard care because they cannot tolerate the needed procedures. The persistence of undiagnosed/poorly treated medical conditions has more negative impacts than physical deterioration. Pain expressed as challenging behaviors may have a significant impact on educational, vocational, and living options for the ASD individual. A condition undiagnosed/untreated may require more intensive and expensive treatment and may be more difficult and traumatic for the patient.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Additional research into the cause of increased co-occurring medical condition prevalence is needed. A study using a large sample size of SPARK data found that 74% of individuals with ASD had at least one comorbidity and had a greater average number of comorbidities than their non-ASD siblings (Khachadourian et al., 2023) which would suggest that something specific to an individual's autism diagnosis is correlated with the presence of the co-occurring medical condition. Second, while many caregivers report atypical symptoms among their children, there is limited professional understanding of these idiosyncratic symptoms or their etiologies. Knowing more about the cause of and presentation of co-occurring medical conditions in individuals with autism can result directly in improved care and outcomes.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services,</p>	<p>First, effective medical care for autistic patients can be improved by requiring formal education and training for healthcare providers on the complex presentation of autism in their patients and the most common co-occurring medical conditions. Healthcare providers who are well-versed in autism-friendly practices will provide better care resulting in better health outcomes.</p>

<p>insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Also, systemic changes in healthcare administration and third-party payor policies can result in improved care and outcomes. Providing adequate funding for hospitals and other medical providers to implement autism-friendly practices would incentivize healthcare organizations to take on these efforts. Changes to reimbursement rates and billing codes could allow for longer medical appointments for autistic patients, more case collaboration among professionals, and billing by behavior analysts in medical settings. When any of these things are piloted as quality improvement projects or via grant money, they show positive results (Boston Medical Center (n.d.) Autism-friendly initiative); the ability to expand and sustain these efforts can improve the health, safety, and quality of life for the autism community.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	

Name	Autism Society of Idaho
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy Low Tone
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of accommodations in the workplace or by the states in the case of licensing requirements
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Workplaces should accommodate neuro-divergent individuals
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Autistic Adult and Autism Researcher
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	An under-recognized and often overlooked challenge caused by co-occurring conditions is food selectivity (picky eating), as well as restrictive eating and trouble recognizing hunger cues. Eating difficulties arise as early as 6 months of age in some individuals with ASD and frequently persist into adolescence and adulthood with few options for intervention and support, sometimes associated with gastrointestinal health issues, nutritional deficiencies, and increased stress among individuals and their families. The act of eating is not just a necessary behavior for sustenance but is also a crucial component of social and sensory development. Research is needed to better understand the impact of prolonged eating challenges in autistic adults, how eating challenges relate to co-occurring disorders such as ARFID and anorexia nervosa, how such challenges develop, and how treatments and supports can be developed and refined for autistic children and adults alike.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Significant challenges include eating and feeding disorders such as ARFID (more common in children) and anorexia nervosa (more common in adolescence and adulthood). Autistic individuals are more likely to be resistant to typical treatments for eating disorders and may require unique supports. Given that anorexia nervosa has an extremely high fatality rate, it is important that autistic individuals struggling with this disorder are given effective treatment. Other impacts of such eating disorders in autistic people include difficulty and avoidance of eating in social environments, gastrointestinal health issues, nutritional deficiencies, invasive medical procedures (e.g., feeding tube insertion), and being over- or under-weight. Additionally, attention-deficit hyperactivity disorder is a commonly co-occurring condition which can impact learning outcomes and ability to form and sustain social relationships.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Eating disorders, which are often overlooked as commonly co-occurring with autism, impact physical health (e.g., dizziness, fainting, weight), ability to concentrate, and social relationships. Many social interactions occur over a shared meal, and eating disorders can limit a person's social opportunities.
What additional research is needed to help address co-occurring conditions for autistic people?	Research is needed to better understand how eating challenges relate to co-occurring diagnoses and symptoms of ARFID and anorexia nervosa. Research should also examine how eating challenges develop and how treatments and supports can be developed and refined for autistic children and adults alike. Longitudinal studies are needed to understand how eating challenges change throughout the lifespan, as there is very little research in this area. As a result, it is unknown what the long-term impact of food selectivity is on autistic adults and adolescents. Additionally, there should be research into the potential role of gender and eating difficulties in autism, as autistic girls may be more prone to anorexia or food selectivity than autistic boys. Finally, research should explore the value and efficacy of food supports such as food delivery apps, personal care attendant to prepare food, etc to determine whether such services should be made more publicly and financially accessible to autistic adults.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services,	Providers should be trained in the care of autistic people and should understand the heterogeneity of the autism spectrum. As an autistic adult, I have had my autism needs dismissed in the medical setting when a doctor who is treating another one of my conditions does not "see" me as autistic because I am a high-masking, intelligent adult with low support needs, but

<p>insurance coverage, service systems issues, patient-provider interactions)</p>	<p>needs nonetheless. Services for co-occurring conditions should be made more financially accessible for autistic people, especially regarding insurance coverage. It has been difficult for me to access services because my psychologist specializing in both autism and ADHD in adults is not in-network despite this psychologist being the only neurodiversity-affirming adult specialist in my area. It would be very helpful to have access to food and item delivery services without paying an added cost, as co-occurring disabilities like ADHD and eating disorders can make the process of shopping in-person very difficult.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>As an autistic adult, I felt very isolated when COVID-19 began and have still struggled to make friendships since. My social anxiety increased due to the pandemic.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Increased remote work has helped me decide whether to go to work in-person or remote according to my social battery. This has helped me prevent autistic burnout.</p>

Name	Ava
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Chronic overwhelm from sensory overload - leading to daily headaches and fatigue. Also comorbid conditions: hyper mobile ehlers danlos syndrome, POTS, MCAS etc.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety - constantly overthinking and analyzing and planning ahead (because of fear of limited energy levels), which is incredibly stressful and draining
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Often being misunderstood or tone of voice being taken as aggressive. Trying to communicate and be received properly is very taxing
What additional research is needed to help address co-occurring conditions for autistic people?	Studies on females specifically. Extra high rates of reproductive issues, hypermobility, brain issues (inflammation), overlap with adhd etc
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Absolutely insurance coverage, but also more training in Med school. So many "experts" don't know what high masking autism looks like, especially in those assigned female at birth. racial minorities deal with the impacts most
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I've been infected 4-5 times. I'm sure it has only negatively affected my cognitive + fatigue issues
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Azure
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have EDS which is more common in autistic people. The physical pain it causes me significantly impacts my life. My autism makes me more sensitive to pain in some ways. Many people with higher support needs, who would likely have difficulty finding out about this survey and possibly completing it, have more severe comorbidities.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have PTSD because of the way I was treated due to symptoms of autism and ADHD in k12 school by my teachers. It makes it incredibly difficult to navigate the world because I am constantly on guard. The people who caused this trauma will have long careers because nothing they did was technically illegal. Better protection for autistic (or potentially autistic) students in schools would be incredible.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Due to the format of this questionnaire it will likely be difficult for many people with intellectual disabilities to find and respond here. I personally have dyscalculia and my problem has always been getting colleges and schools to respect my request for accommodations. Professors who do not believe me will do everything possible to not allot me extra time for tests and due to their tenure or time at the college will face no consequences for it.
What additional research is needed to help address co-occurring conditions for autistic people?	There is a tremendous lack of research for high support needs autistic people that addresses their own concerns about themselves and not the anxieties of allistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I have a horribly difficult time with paperwork that often leads to difficulties in my life. A service where an aid helps walk me through the process would be incredibly helpful for me.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I have social difficulties due to my autism but I love to go out and I love to be around people who are understanding. I was also born with orthostatic hypotension. This condition can be caused by COVID 19. Should I ever get COVID 19 mine would likely get worse, permanently. The lack of precautions has forced me into isolation.

Name	B
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Co-Morbid disorders. I have Insomnia, IBS, Gluten intolerance, sensory issues that relate to touching things and eating them. Long term motor and physical issues, like toe walking turning into issues with my knees and collapsed arches when standing. Hypermobility is also an issue. I have issues not understanding my body cues, such as hunger, bathroom use, water intake.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have ADHD, anxiety, social and generalised, impulsive and intrusive thoughts. Issues reading social cues and understanding normal behaviour that leads to isolationism among peers or only being sought out for a purpose. It can also risk my safety in public if I misunderstand someone else and their intentions which has lead to me responding improperly and getting assaulted. I also have issues understanding my own emotions which can look like apathy to others.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I was too advanced in something and delated in others resulting in not getting a diagnosis based on childhood criteria. I picked up reading took quickly but jot speech. I was good at maths and sciences because they're hard facts but failed at language arts and social studies because they're often more nebulous in context and harder to understand and communicate on, compared to solid facts. That, along with social issues, anxiety and other co-morbid issues already talked about make school not a good place for people like me. I've tried college four times and didn't finish.
What additional research is needed to help address co-occurring conditions for autistic people?	Research into groups beyond white males. You need other minorities, women, queer folk, all across the spectrum of society to understand these issue. Especially those diagnosed as adults because we didn't present with typical white male child symptoms.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Testing that doesn't rely on childhood things, especially for those seeking a diagnosis as an adult. Less hoops to jump through to get coverage. More health insurance options that don't have us paying out of pocket for testing or support because we're not children. More training for the in authoritarian positions like doctors and nurses and psychologists on how to interact with us and mandatory reading of the internal DSM and US DSM latest copies.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Some of it was good. A lot of us who suffer from social issues were able to use written forms of communication versus trying to understands someone's tone, body language, facial expressions, etc. A bad thing would be the anxiety caused by the country's poor handling leading to a lot of misinformation and misunderstandings, especially regarding autism and vaccinations. Again.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	It was good for a while, a lot of jobs were letting people work remotely or hybrid but now a lot of companies are backpedalling on that and requiring documentation despite productivity being up for a lot of these companies. Which ahas then led to issues with people scheduling appointments, increased social interactions and misunderstandings and obligations which lead to burn outs.

Name	B. Blair Braden, Arizona State University
Demographic	Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of autism-informed providers or tailored interventions/approaches.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	There is a huge need for large-scale clinical trial funding. Many of the NIH ICs will not fund autism efficacy trials. This is particularly problematic for adults as interventions tailored to adults is only a recently emerging field. Yet, the opportunities to fund research that can build evidence-based interventions for autistic adults is severely lacking.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More funding for large-scale clinical trials. There are a plethora of pilot studies that show promising effects for addressing co-occurring issues, especially in autistic adults. But there is very little funding to execute large-scale clinical trials that can establish efficacy and move these interventions into services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Barbara Baker, parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My daughter has gastrointestinal issues, poor sleep, epilepsy and sensory challenges. All of these variables are constantly changing. It is difficult to tell which of these (if not some or all) are contributing to her changing behaviors and moods. I am constantly in "fix it" mode, trying to figure out where to focus attention. It is extremely complicated and something that only I can do. This makes me nervous as we think about her living away from us. No one else will know her and be able to help her like I can.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Along with all of my daughter's "health issues" she also has intellectual, communication and developmental disabilities. This makes figuring out her needs even MORE difficult as she cannot tell me how she feels or what is bothering her. Also, she cannot read or write. It is a constant guessing game caring for her.
What additional research is needed to help address co-occurring conditions for autistic people?	I would like to see more research in the area of biomedical issues for people with autism. We seem to have good success when we treat her health issues -- this results in improved behavioral issues and better learning. I don't think a lot of practitioners believe it, but it just makes sense. Pushing heavy drugs on people with autism is not always the answer. Getting to the root of their behaviors needs to be better researched.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	For many of the biomedical interventions we have had success with, they are not covered by insurance because they are deemed "exploratory". I would like to see more insurance companies recognizing that all care for complicated individuals with autism is worthy of coverage. Especially since no one knows for sure what works for this population. It's truly all still trial and error. So do not dismiss possible treatments as not worthy of insurance. Also, more practitioners need to be trained to care for people with autism. There are not enough and there is a great need for them for the future.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I only gave our daughter 1 vaccine (J and J) because she her immune system is very compromised and I didn't want her to have too many injections. I am more afraid of the artificial vaccines for her than the virus itself. I think that as a general rule that many individuals with autism have regressed after having numerous vaccines. Many are very sensitive to the vaccine and the ingredients due to over active immune systems. Also, in general, being even more isolated during covid has led to many challenges for autism families related to housing shortages, staff shortages and the inability to practice skills in the community. Much regression has occurred for people with autism as a result of the pandemic.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	See questions 6 response

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	BAT
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Co-occurring health conditions are especially difficult for some autistic people to manage. This is especially significant for individuals that suffer from the sensory, communication, and poor interoception. Autistic folks may have difficulty realizing there is something wrong and even more difficult deciphering what the location or body system is affected. Even if they know what's wrong they may not have access to medical care or the communication supports needed to access care. Further, because medical professionals have little, wrong, outdated, and/or (often) bigoted views of autism, the patient might not be believed. Autistic patients have medical trauma from being denied informed consent and not being believed. Autistic folks may not reach out for help due to all of these issues which can make comorbid conditions much more significant without intervention.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Because of the way that the DSM and psychological research is (by this, I mean it pathologizes any behavior that does not conform with conservative cultures and capitalist values), many autistic folks have been misdiagnosed and therefore been given improper intervention/treatments. The main treatment offered to autistic children is ABA which is described by most autistic adults as torture. So, even if an autistic child is offered early intervention, their life-long mental health is affected by that treatment. This makes it difficult to parse out what conditions are co-occurring or which behaviors are just a result of being insufficiently supported.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	It is often assumed that non-speaking autistic folks have developmental disabilities which affects their independence. Often teachers and therapists are taught to consider ONE disability at a time. Children who have more than one diagnosis or educational disability label are often mysteries to school and intervention staff and often mis-served.
What additional research is needed to help address co-occurring conditions for autistic people?	The relationship between autism and gender differences. The relationship between autism and Ehlers-Danlos Syndrome. ABA needs to be looked at without submitting more individuals to the torture. What are the long term affects of children being treated like dogs for hours every day? More research into neurodiversity affirming care and interventions. Clinicians need to find ways to help autistic folks navigate the world instead of trying to "fix" them. Autistic folks don't want to be cured.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More access to augmentative and assistive technology (especially communication), neurodiversity affirming therapists, insurance coverage (more than just ABA), more clinician education on co-occurring conditions.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Anxiety, depression, isolation, flares of co-occurring chronic illnesses making supports harder to access. Clinicians ignoring the pandemic and blaming anxiety.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Beatrice Alvarez , Parent
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Consistent GI issues that require prebiotic & probiotics, sensory issues with clothing softness, not able to tolerate socks, hair intolerance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety in New places. My son has trouble using a single stall bathroom for the 1st time in a new place e.g., hotel, visiting home. He has to talk himself thru it or need someone to help him get past the threshold that he's going to be ok. Once past it, it's fine after that
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	IDD but my son also has Downs. It's hard to tell from which of these it came from.
What additional research is needed to help address co-occurring conditions for autistic people?	Mental health help, talk therapy, social group therapy, social stories, social practices, behavioral therapy
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage of mental health therapies
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Reduced social interaction and setback in terms of social progress

Name	Bella
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Definitely sensory and motor condition's. Mainly because for major stuff like learning how to drive, leaving the neighborhood on my bike, etc. I have a literal mental blockage that prevents that ability from happening unless I physically push pass it. Along with the fact that I have meltdowns from time-time if something acts as a trigger. Caffeine & sugar also make me pass out.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Definitely depression, anxiety, and ADHD. The ADHD more specifically because of the fact that ADHD symptoms tend to be the opposite of autistic symptoms. Which means you have to attempt to find a balance.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	All of the above in all honesty. The learning disabilities makes math extremely hard for me. And communication disabilities is worse because it means, in combination with my ADHD, I can't keep friendships because I literally forget to message people. Or don't because we don't have similar special interests.
What additional research is needed to help address co-occurring conditions for autistic people?	Just, talking to autistic people. There's different things that help all of us because not one autistic individual is the same.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Bella Taylor
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Fibromyalgia
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD BPD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Chronic pain, overlapping diagnoses of ADHD and BPD
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Bellamy
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have a lot of sensory issues that affect my ability to take care of myself as well as perform the requirements of my job. Smells, lights, and sounds, and textures all become overwhelming very quickly. When my nervous system gets overwhelmed I usually begin to experience muscle ticks that are involuntary and have resulted in dangerous working conditions for me in the past. I also get what I call "tick attacks" where a particular tick gets stuck in a loop and I am unable to stop it for a length of time usually resulting in joint and muscle pain.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Before learning I was autistic I had a very confusing mental health journey. Between the ages of 12-18 I've had so many diagnoses thrown at me, anxiety, major depressive disorder, narcissistic personality disorder, bipolar personality disorder. I believe I would have had a much better childhood if I was able to be diagnosed correctly before going through all sorts of treatments and therapies and group homes I could have avoided so much trauma and emotional dysfunction. My working memory is in the 30th percentile due to PTSD. This makes keeping track of conversations difficult. I tend to forget what I'm doing as I'm doing it. I have struggled for a lot of my teen and adult years with self-harm and suicidal ideation a lot of which stems from feeling like my brain is broken and there are no good options for me.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	If I was given a learning environment better equipped for my sensory and learning needs my life would look SO MUCH DIFFERENT. I struggled a lot in school both academically and socially. However I only struggled academically when I couldn't understand directions and no one would take the time to explain it or was too overwhelmed with sensory issues to do the work.
What additional research is needed to help address co-occurring conditions for autistic people?	Please please please study more into autistic women and autistic individuals assigned female at birth. I was tested as a young child and found to not have it. Likely because I had a huge vocabulary for my age and appeared socially secure. (Both changed quickly as I continued to struggle through school and a world that wasn't built for my brain)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Medical staff should be trained to slow down and explain what needs to be done and leave room for questions and accommodations. Hospitals are quite traumatizing for me and I think it wouldn't take a lot for them to be a whole lot better for folks with autism. Many autistic people can't drive, me included. We should have transportation available for those who can't drive themselves. (I cannot ride the bus alone because when I disassociate and hallucinate I become incapable of recognizing where I am in the world and how to keep myself safe in public.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I don't believe that COVID has had a significant effect on my autistic symptoms.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	I have found that the decreased social obligations due to COVID have allowed my nervous system a bit of a rest. Telehealth has been wonderful. Before I would opt to not address medical issues because hospitals and clinics are so overwhelming (bright lights, noise etc.)

in-person social interactions and obligations)	
--	--

Name	Ben Yerys, Children's Hospital of Philadelphia
Demographic	Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	One of the most significant challenges is identifying speciality care providers who treat co-occurring physical health conditions. The lack of access to care is a major barrier across the lifespan, but felt the most in adulthood.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	-Access to trained providers, particularly med management for adults - Increasing awareness of co-occurring mental health in autism+ID populations—the potential for diagnostic overshadowing is large in this segment of the autism population -An absence of gold-standard treatments/supports that help autistic people manage co-occurring mental health conditions and also focus on positive mental health (e.g., decreasing ADHD symptoms does not automatically equate to a greater life satisfaction) -Insufficient characterization of how co-occurring mental health conditions impacts daily functioning - A patient told me "Don't treat my autism, treat my social anxiety" because his anxiety was a rate limiting step for friendships, self-advocacy, going to college -Depression and suicidal behavior is growing exponentially in the autism population without intellectual disability. Autistic people, particularly autistic women and nonbinary people, should be identified as a 'high risk' group for depression and suicidal behavior
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research to establish gold standards for screening/diagnosing, treatment, and treatment outcomes related to co-occurring mental health. The greatest gap is screening and diagnosing co-occurring mental health conditions, because most clinicians use tools developed in non-autistic populations and assume they work the same for autistic people. On the whole, this is not true and may lead to over- or under-identification depending on the specific condition. The ability to screen/diagnose co-occurring mental and physical health conditions is compounded in those with autism+ID.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	-Equitable access to psychiatric medication, particularly for adults -Enhance autism services (Medicaid Waivers, vocational rehab) by providing support for mental health accommodations in addition to physical health accommodations -Identify opportunities to enhance research on self-advocacy/self-determination among autistic people of all ages, so they can advocate for their mental health needs.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic	

people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Berkeley Fisher
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep challenges, sensory issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression, anxiety, ADHD/concentration issues
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research women with autism!!! Research the FULL spectrum!!! As a woman, I wasn't diagnosed until I was 26. I struggled my whole life with learning differently, feeling alone, sensory overload. I also think it would be EXTREMELY beneficial to conduct study on social impact on autism. It's a huge challenge being in a social situation/society that does not acknowledge sensory issues, or a society that thinks directness is rude. We are ostracized and it can impact our ability to work. Another good study could be autistic adults in jobs - corporate/desk jobs specifically and reasonable accommodations. Or autistics in post-secondary education. In grad school and corporate America, I was often given poor reviews because I couldn't grasp certain things. There needs to be a better understanding of what autism looks like and the limits we have.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for the full ASD spectrum, providers (medical and mental health) get better training on ASD to combat overall ignorance, and some type of policy that builds on ADA to incorporate sensory accommodations
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	This is not applicable for every autistic. Not all of us struggled during the pandemic. Please don't focus the entire research on COVID-19 impacts on autistics. PLEASE. THERE ARE MORE IMPORTANT THINGS WE NEED YOU TO COVER AND UNDERSTAND.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Bern.W
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Dyspraxia Dysgraphia Sensory Processing Disorder Rejection Sensitivity Disorder Tourettes Syndrome Food allergies Asthma and sinusitis chronically Unable to make enough melatonin, serotonin Depression and high anxiety Demand avoidance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety Demand avoidance ADHD Suicidal thoughts Chronic burnouts Frequent meltdowns Fluid adaptability that can look like regression during burnout Losing the ability to speak in high stress periods
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	ADHD Dyspraxia affects posture and balance Difficultly crossing the midline which affects reading and writing! Poor muscle tone in hands Auditory Processing Disorder Cerebral Visual Integration challenges the eyes can see but brain can't interpret Apraxia
What additional research is needed to help address co-occurring conditions for autistic people?	Please we need research so that medical professionals will understand Pathological Demand Avoidance is a disability under the autism profile. It is not a choice it is Pathological. It is very difficult for young Pda'ers who can not cope in schools and parents have no support without an official diagnosis. Include actual PDA identifying ppl to get the best info about it.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Chronic fatigue Weakened immune systems
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote working Flexible hours Homeschool support More contact via email

Name	Bernadette
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The motor and sensory issues affect one's ability to retain employment and the people they live with.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	All of the above issues affect employment and social interactions. Also, obsessive-compulsive disorder with disturbing thoughts makes it difficult to complete tasks.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	They have difficulty with executive functioning which means can't prioritize, plan, organize or be dependable.
What additional research is needed to help address co-occurring conditions for autistic people?	More community based or closer programs for individuals to find environments that are unique to one's needs. Supportive housing so they can develop confidence and feel responsible and productive for their own life.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Supportive housing in or near one's community and employers that will hire and support individuals with their specific issues.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Unemployment, excessive loneliness, and boredom is what they get up to every day.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My son's life already had negative impacts before the pandemic, and nothing has improved for him and the stress on the family.

Name	Beth Greenspan
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	1. Getting the medical care I need including: support to and from doctors, hospitals for non-drivers, support at the medical facilities, and dealing with medical staff. Because I am not getting the treatment I need, my conditions are worsening as I age. I am sixty now and I have more ailments and less care. 2. Paying for care. As a person on a fixed income with Medicare and Medicaid, and they do not cover many things, such as many good quality dermatological care, dental care, progressive lens eyeglasses, etc. 3. Doctors who have no understanding of challenges for people on the autism spectrum. Doctors who will not work with my needs. And insurance companies, who do not care about actual human beings at all. For instance, I know I have sleep apnea. It was long ago witnessed by a relative. But my doctor says I must go to a sleep clinic, which I cannot do for so many autism-related reasons.. So I am not being treated for this disorder. 4. Self-care. I have so many challenges in this area, and I have no way to improve them. No adequate support, no money, and a whole long list of aversions, rituals, sensory issues, that prevent me from taking better care of myself.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The medications I take for my mental health issues cause extreme lethargy, and they are also damaging my organs due to long time use. Being caught in the psychiatric system for most of my life, when what I needed was care for my autism. Being overmedicated, and misdiagnosed for many decades. The psychiatric models of treatment do not work well for people on the autism spectrum, and in the long run, ended up doing more damage to my brain by constantly overloading it, and constantly focusing on goals that were unachievable for me.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	There has always been such a strong emphasis on being social, and communication skills. I have no desire or need to be social, even though I can communicate well. But it is entirely exhausting and overwhelming for me to be forced into being more like others.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Drastic improvements in care for low income people with autism, specifically with Medicaid. I am forced to follow the cookie-cutter rules of the autism waiver I receive in order to receive services. The waiver should be flexible to allow for the widely different kinds of people on the autism spectrum. And being able to find good quality doctors in all fields who also have knowledge or training of how to treat people with autism. How to adjust to our needs. Also, much better (reliable, consistent) accessibility for people who do not drive to get to these services. And finally, better wages for providers working with autistic individuals with low incomes.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The pandemic has caused me to become even more home-bound than I was before. It has made being in public so much more challenging than it was before. Not only because of sensory issues, but because I am at high-risk for catching viruses, so it is easier and more comfortable to just stay home. And receiving healthcare has become more challenging, more challenging than it was before because I have less support due to staffing shortages and staff being out sick with viruses. As a low income disabled person with many needs, I have become even more low income due to rising prices, lack of resources, and lack of decent affordable housing in my community. Also, a

	widening gap between the "haves" and the "have-nots". And the technology gap has widened also.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Beth Malow, Vanderbilt University Medical Center
Demographic	Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep problems affect 50-80% of autistic people. They not only impact health, but also daytime behavior for the autistic individual and quality of life for the autistic individual and their family. It's a terrific opportunity to be able to impact daytime functioning through improvement in sleep and should be given full consideration in research.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Treatment trials, particularly of sleep problems, are critically important for autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Bethany Coop
Demographic	Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal issues can make it difficult for families to go out into public. Having a child with incontinence, reflux, and other health related conditions can cause embarrassing situations such as vomit on a restaurant table. We have sought out medical support for these issues and have been told that "its just something children with disabilities must learn to live with." My child has constant sores in his mouth. We never know from day to day if he will be able to keep food down. He has constant stomach aches from the symptoms of encopresis. These physical health conditions can also lead to mental health and behavioral issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My child suffers from social anxiety, depression (uncontrollable crying), aggressive and self-injurious behaviors. He has scars all of his body from things he has done to himself. We never know if we will be able to enjoy family events or if he is going to melt down as a result. When walking down the street things like a car or motorcycle can send him in a panic. He grew up at a time that ABA was not available and as he is "non-verbal" mental health providers couldn't help him either. Schools don't have the capacity for these kids.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My child is able to communicate only through his made up signs. He becomes frustrated and upset when other people don't seem to understand his needs. He has global delays which prevent him from being able to transition throughout the community without assistance, and we have to front load everything. He will never be without supports. I do honestly believe the science is out there which could have helped him become more independent. There just isn't enough providers, funding, or supports.
What additional research is needed to help address co-occurring conditions for autistic people?	EVERYTHING! We need more research into all the mental, physical, and developmental issues which face these children. I believe there are providers out there who have barely touched the edge of the iceberg. These children deserve to live happy, independent, safe lives just like everyone else. It is the lack of understanding and treatments available which hold them back.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need access to services which are in alignment with best practices rather than being controlled by other variables. Wait list and the silo's covering government service providers need to be eliminated. We need cooperative treatments, where therapist, physicians, social services and educators work together to address all of the needs of the child together. One contact to help families navigate all systems and work as the go between to improve provider relations.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The most common mental health/behavioral issue I have noticed as a professional is social anxiety. People spent two years locked in their homes. For the first time in 15 year we are treating children who are unable to be outside of their homes and away from their families.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Providers are unable to attract quality service providers. And the providers they do have are more susceptible to colds and other illnesses. There is also an increase in mental health and capacity related issues among providers. This has led to long wait list, inconsistent application of therapy, and increased burnout.

Name	Betsy Pilon, Hope for HIE
Demographic	Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Etiology of autism is incredibly important. Neonatal hypoxic ischemic encephalopathy is an understudied etiology for autism, but we know that HIE increases the incidence of autism and autistic traits. In HIE, co-morbidities include a wide range of impact areas including cerebral palsy, epilepsy, autism, hearing and vision issues, learning and attention issues, GI, speech, swallowing and feeding, dysautonomia, and more.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	All of the referenced challenges exist with HIE as an etiology for autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	All of the referenced challenges exist with HIE as an etiology for autism.
What additional research is needed to help address co-occurring conditions for autistic people?	Etiological research is needed, and especially focusing on mild HIE cases that have a higher than average co-occurrence with autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Go back to known etiologies and educate families early on with the prevalence and services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation has been extremely difficult for patients and families, as well as exacerbated illness and impacts from COVID-19 itself.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	All of the above referenced.

Name	Betty Lehman, Lehman Disability Planning
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders: especially in nonverbal; much suffering leading to self-injurious behaviors Hypotonia resulting in kyphosis: low tone is very common yet gets no attention to long term disabling outcomes
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Workplace anxiety is not sufficiently addressed or supported
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Some profoundly affected can speak but don't have abstract thinking - so they can't understand or communicate about information that is not within their lexicon and are misunderstood
What additional research is needed to help address co-occurring conditions for autistic people?	More research on methods to address public and workplace anxiety for those who employ or support people with IDD
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance and Medicaid often denies coverage for more extensive physical examinations for GI related disorders
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Those who don't understand why they need to protect themselves against spreading disease become anxious because they don't understand why their Day program closed, for example, or why they can't behave in ways previous to Covid precautions.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Some on the spectrum are germaphobes. Their anxiety and fears about germs have escalated and not come back down.

Name	Beverly Frost, parent, autism advocate
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor challenges, specific learning disabilities, despite high IQ inability to care for self, mental illnesses, depression.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant mental illness problem is lack of understanding mental health professionals and the state to refuse mental health care for those with autism. Autistics may have one or more mental health conditions such as anxiety, depression, ADHD, aggressive or self injurious behavior, suicidality and as in my 58 YO son all of the above many due to lack of appropriate care.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication, LD, DD, IDD
What additional research is needed to help address co-occurring conditions for autistic people?	Vermont does nothing for adults with autism Yes, they spend huge sums of money but have no one in the AHS system with any knowledge, training or expertise in ASD. The most needy are placed in rural isolation with caretakers with no autism knowledge or training. Needed are comprehensive centers of autism excellence that treat the whole person using real professionals. I just about lost my son, now 58, had to find out of state services.and pay for them, then develop a program and implement it myself. He was able to become productive and work but had so much higher potential with better services.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Medicaid must not be the only requirement for developmental services. My son managed to have just a little too much money for developmental services. There was no way he could "lose" the income. Yet, his private income was just over Medicaid levels and certainly was not enough to provide for private services that didn't exist anyway. He could only get mental health care by providers who knew nothing about autism. A comprehensive approach was needed. Vermont and especially my rural area has no qualified autism experts in DD care or mental health.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Much less care and much more isolation.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	I eruptions in service care and isolation.

increased use of telehealth, reduced in-person social interactions and obligations)

Name	Beyza
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	when you don't have enough information on autism, or cannot get help from others there is really no way of escaping depression & anxiety. I am gonna continue in turkish. doktorlar çoğunlukla otizmli olduğumdan şüphe ettikleri için açıkça otizm semptomlarımın görmezden gelinmesinden kaynaklı sorunlarıma yanlış tanı koyabiliyorlar. mesela otizmli olduğum için beni mutlu eden şeylerden bahsetmek beni çok heyecanlandırırsa da sırf bu yüzden manik olduğumu sanan doktorlar vardı. (özel ilgi alanı vs.) [Translation: Because doctors often suspect that I have autism, they can misdiagnose my problems, which are clearly caused by ignoring my autism symptoms. For example, although I was very excited to talk about the things that made me happy because I have autism, there were doctors who thought I was manic just because of that. (special interest etc.)]
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	iletişim farklılığım yüzünden insanlarla kolay kolay arkadaş olamıyorum çünkü beni yanlış anlamaya çok meyilliler. bu durum beni çok üzüyor ve bu yüzden sıklıkla depresif hissediyorum. [Translation: Because of my communication differences, I cannot easily become friends with people because they tend to misunderstand me. This situation makes me very sad and I often feel depressed because of it.]
What additional research is needed to help address co-occurring conditions for autistic people?	otizm, özellikle kadınlarda bipolar bozukluk veya BPD gibi kişilik bozukluklarıyla çok karıştırılıyor. bu çok büyük bir haksızlık ve beni AŞIRI rahatsız ediyor!!! [Translation: Autism is often confused with personality disorders such as bipolar disorder or BPD, especially in women. This is so unfair and makes me EXTREMELY uncomfortable!!!]
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	insanlarla fazla iletişim halinde olmak zorunda olmamak rahatlatıcıydı. maske taktığım için yargılanmıyordum çünkü herkes takıyordu. (daha önce yüzümün görünmemesini istediğim için maske takmışım ve bu yüzden zorbalığa uğradım) [Translation: It was a relief not to have to interact with people so much. I wasn't judged for wearing a mask because everyone was wearing one. (I wore a mask before because I didn't want my face to be seen and I was bullied for it)]

in-person social interactions and obligations)	
--	--

Name	BJohnson
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenge is a lack of knowledge and screening of some of the co-occurring conditions of autism. Namely, Ehlers Danlos Syndrome- Hypermobility Type is a co-occurring condition to autism, and, although my family member had loose joints, frequent subluxes, loose, stretchy skin, and extreme hypermobility, no one ever mentioned it until they had multiple dislocations. Screening would have gotten us PT interventions sooner. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7711487/ The same can be said for a lack of both knowledge and screening of POTS (postural orthostatic tachycardia syndrome). https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8756818/ These common co-existing conditions can be rare in the general population, but are not as rare in the autistic population and therefore there should be screening and education. For our family hEDS has profoundly impacted our lives and we are constantly educating physicians who are unfamiliar with it and/or best practices for treatment.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The female presentation of autism often looks more like generalized anxiety disorder in the earlier years. This may be due to extreme masking. PDA (pathological demand avoidance) is a subtype of autism and is, by far, the most challenging, and least understood condition in our experience. Understanding PDA as a nervous system disability is crucial when working with Autistic patients who present with a PDA profile.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For us, verbal processing delays present a significant challenge and show up at school, despite high cognitive abilities.
What additional research is needed to help address co-occurring conditions for autistic people?	By far, Pathological Demand Avoidance (PDA) is not widely understood as a subtype of autism and is often thought of as a character flaw or bad parenting. PDA is the number one challenge in our family and needs so much more research on amygdala response. Even in autism circles it is not widely understood or researched.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better screening for co-occurring conditions, and then better multidisciplinary support among specialists treating patients with several co-occurring conditions. It is hard to go from specialist to specialist when they are not communicating with each other.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Some autistic students thrive in remote schooling when in person school was hard to access due to social and sensory challenges. COVID-19 actually made school MORE accessible for a subset of autistic students. This should be a lesson not lost moving forward. Remote schooling should be a viable and equitable option. Remote therapy has created more options for families to

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	access mental health services as well, giving families much needed time back into their day that is not spent driving family members to appts.
---	--

Name	Blair
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Pathological Demand Avoidance, or Pervasive Drive for Autonomy (PDA) Somatoform disorder Non epileptic Seizure disorder
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological Demand Avoidance, or Pervasive Drive for Autonomy (PDA) Somatoform disorder Anxiety disorder
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Pathological Demand Avoidance, or Pervasive Drive for Autonomy (PDA)
What additional research is needed to help address co-occurring conditions for autistic people?	Pathological Demand Avoidance
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Accessible social programs, education accomodation, in home support,
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increased anxiety and nervous system dysfunction
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Brandi Johnson
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	In my 10 year old it would be his sleeping patterns. He is able to stay up for days
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Comprehension issues triggers behaviors and causes severe meltdowns
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Comprehension is always a top concern because it hinders him in learning settings also communication and staying on topic holds my 10 year old son back
What additional research is needed to help address co-occurring conditions for autistic people?	School grade kid and parents need more support when dealing with schools "IEP"
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services like ABA need to have real life environments centers plus the in home services More programs like IHSS PROTECTED CARE services so parents with autistic kids can provide care 24/7 without the stress of finding someone to watch/care for these certain kiddos
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The online schooling was a big set back. Learning and social skills suffers a lot

Name	Brandy Joy Leigh
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Finding providers who are trained/specialise and are sensitive to providing comprehensive care across disciplines.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Isolation, lack of opportunities to participate in community on their terms and sensitive to their needs
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The systemic attitudes that view autism as a pathology. We need services and providers who do not pathologize behaviors and are more accepting.
What additional research is needed to help address co-occurring conditions for autistic people?	Research the behaviors/attitudes of allistic people and how they negatively affect those with autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Breana Turic
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances impact me on a daily basis. I cannot fall asleep like a neurotypical person, sometimes my brain will not stop working for 2-3 hours after laying in bed. Other times I will wake up to use the bathroom and then be unable to fall back asleep for the remainder of the night. These disturbances lower my threshold to adapt to everyday environmental stimuli and social situations making it easier for me to get overstimulated or have a meltdown during situations I may have been able to adapt to if I had proper sleep. For my autistic daughter, motor challenges are one of the issues that impacts her attempts to interact with other children the most as she is unable to play sports, run, do kart-wheels, etc. like the other children. She still cannot grasp riding a bike while all of her peers can. Being unable to engage in many activities that her peers are doing makes the already difficult process of making friends even more challenging for her.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My daughter and I both have comorbid diagnosis' of autism with ADHD and while the ADHD may hide many of our autistic traits, it also causes some of the biggest mental health hurdles for us both. ADHD paralysis makes completing daily tasks such as hygiene, chores, or classwork a huge struggle. We both have to increase environmental stimulation to optimal levels in order to achieve normal productivity, while at the same time battling the overstimulation this can cause at the same time. We both also present in a pathological demand avoidance profile of autism meaning that our autism manifests in extreme anxiety oftentimes by something as simple as the thought of being perceived by others which makes tasks such as running errands a very stressful event for our bodies.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research on the effects of ADHD medication for people with AuDHD is my biggest request! Many ADHD medications do not work the same for people with autism and ADHD so researching which uptake inhibitors are affected by medications for us is extremely needed at this point.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I would love to see the United States catch up with the UK for financial disability assistance for people with autism. The state of the economy necessitates a two-income household to be able to meet middle class living expenses so couples with one or more partners on the autism spectrum unable to meet the typical eight hour per day, five day per week, work schedule are under extreme financial pressure. Most workplaces are a sensory and social stimulatory disaster for people with autism leaving us a choice between masking with extreme mental and physical health consequences, or choosing alternative work from home options which are not financially stable. We need more financial assistance from our government.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	In many ways COVID-19 improved mental health for people with autism as it offered more work from home options as well as contactless services and delivery options reducing social pressures. If these options could remain open to those with disabilities I believe it would greatly improve the mental health of the autism population sustainably. I have a reduced immune system correlating with my disability so as far as physical conditions go,

	<p>COVID-19 reduced my body's already lowered ability to fight upper respiratory illnesses and I often get sinus infections, ear infections, walking pneumonia, and other related issues due to the constant re-occurring upper respiratory infections.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>As I mentioned previously, the societal decrease in social pressures and demands has greatly improved my mental health and the mental health of all my peers on the autism spectrum. We are grateful for remote work and school options and reduced social obligations. If these options could be continually offered for those with disabilities I believe it would be a huge step in aiding mental health for those with autism spectrum disorder.</p>

Name	Brian
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Physical health - from pain to GI, all of it.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Suicide isn't an issue until it's followed thru on. Support should be able to help prior to that becoming an issue.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities with language disorders. I'm already stuck in my own head most of the time. Add to it the issue with learning/and language and it's even worse. You say and think one thing yet the wrong thing gets output.
What additional research is needed to help address co-occurring conditions for autistic people?	A way to read thoughts to translate into text or speech.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Stop forgetting that we grow up! When we turn 18, or 21, that doesn't mean we are magical turn into normal people. Stuff needs better access to adults too.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Unfortunately it made stuff better. Things were more obtainable from stores, and messaging drs and even the delivery stuff. It is horrible that a pandemic had to happen for this stuff but it made stuff more easier to access.

Name	Brian Foti, Non-Speaking Autism Presenter
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The belief that we are not capable of autonomy and independence. We are more capable than we are given credit for and we can and want to be included in decisions that affect our life. I would like more emphasis on how apraxia interplays with autism and how we can work in partnership to develop solutions to this non-talked about challenge among me and my friends. The stress of being "judged" and labeled causes so much stress which then causes sleep disturbances and other physical struggles
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am very impulsive and I feel the professionals may believe that I can control this through verbal prompts. This is not true. I need more concrete instructions on how to stop - Not things like: "We don't touch our friends." OR "Use your quiet voice." These terms are insulting - I really want to be able to control my reactions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I can communicate through a spelling device YET I am not believed and that is horrible. I worked so hard to learn how to spell my thought and my determination is dismissed by those that have never met me or had a conversation with me. Spelling IS a form of communication and they way I can have control in my life and live safely.
What additional research is needed to help address co-occurring conditions for autistic people?	How Motor Challenges affect people with Autism and Down Syndrome. We are important members of the community and many of us want to be tax payers rather than tax takers.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Believe in us and allow our voices to be the driving voice in systemic policy. Many Autistics are misunderstood and until folks that develop policy accept us as content experts - the system will remain unsafe for all of us. We need thriving and accommodations that many general community based environments are lacking - such as more family bathrooms. Do all events really need to have the volume at a unsafe decibel? My friends and me want to be included - but we have sensory differences that can be addressed. For instance - an Autism Awareness event at a sporting event that demonstrated the sensory needs of Autistics.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	We are tribal by nature and need to be social (at some level) to thrive and have our nervous system engaged in a positive way. Taking all social interaction away is much more harmful than the health system accounted for. There is physical and mental health - they live together not separate. Taking our physical interactions away had a grave effect on our physical health. The emphasis on physical safety became the ONLY focus and there was not a solution for how it tore down our mental health. I, personally, now live in fight/flight.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Socialization is so so so important. Isolation causes long lasting mental anguish because we did not have choice - government made choices for us and shamed those that chose not to have vaccinations. Covid shattered by trust in people. Please note - I am a non-speaking Autistic and answered these questions through Spelling on a letterboard. Please, Please listen to us - we have the lived experiences that the decision maker do not have. I struggle to speak - but my thinking and understanding is fulling functional.

in-person social interactions and obligations)	
--	--

Name	Brianna Kerchner
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	There are so many diet restrictions for my son's gastrointestinal issues. Sensory Processing controls his life. He has to wear headphones and have a chew anywhere we go. The public isn't educated enough on these issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety & ADHD are huge struggles in school settings. These kids are supposed to act like "normal" functioning. But they aren't and don't function as such. School in general causes so much anxiety. We need to go back to a more natural learning setting. Kids aren't meant to sit in desks all day.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son is still labeled non verbal. However still has some language. It is hard to keep up such an intensive therapy schedule. He is far behind most of his peers. There doesn't seem to be enough government or state assistance.
What additional research is needed to help address co-occurring conditions for autistic people?	This is a funny question. There is no single person/doctor/place to get all of this information. It takes years of research and different specialists/doctors before you feel like you have even simple answers. There needs to be MASS studies of autism and correlation and better treatments. My child has spent all 9 of his childhood years in therapies that show just a slight growth every year.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	A program like California. Where it helps parents with the costs to give families more access to more/different types of therapies. To give your child the support they need we have to be a 1 adult working household. So the other parent can stay home and make sure our child gets to all of his therapies. And fights insurance on a daily basis for coverage for what a doctor has already deemed necessary. Also making it to where insurance can't deny treatments that a doctor has deemed medically necessary.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Absolutely, they lost out on so much therapy and socialization. Children that are already years behind their peers are now even farther behind their peers. There was nobody looking out for our kids during the pandemic. Our kids could not sit in front of a computer for remote learning. So he was just held back a year. Also sensory wise excluded my kid from the public in many occasions for not being able to tolerate a mask.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disrupting his school was the biggest. He was pushed back a year because he couldn't sit in front of a computer for remote learning. There was many many disruptions in therapies due to outbreaks. And his regression a consequence of that.

Name	Brichard Brummel
Demographic	Autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Some of the most significant ones in my experience have been structural disorders (I have genu valgum "knock knees", medial plica "excessive inner knee tissue", scoliosis, anisomelia "short leg syndrome") Although they've been more minor in treatment, living in society where the symptoms are not as accepted has been very difficult, time consuming, and costly. I've had to see 4 orthopedists before being properly diagnosed for many of my conditions and have been put through physical therapy to no affect to be able to get insurance coverage for my specialist visits and treatments. Being low-income, self-supporting, and a full-time student, this is especially challenging. I would say almost worse than dealing with the conditions themselves. However, the conditions do make it especially hard to work entry-level jobs as often I don't receive physical accommodations and have to do physically intensive labor for several hours, making these co-occurring conditions worse. With sensory issues, I've been able to manage, but as for many of my friends with autism, I know that they have been discriminated against in the workplace, such as being fired or denied a job for having sensory/motor challenges, even when the job was not physically demanding.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>I have co-occurring ADHD and generalized anxiety disorder. With this, it has been hard to learn to self-regulate emotions and express them properly and in healthy ways. As a child, I would have very explosive swings of anger and was not able to learn coping strategies which devolved into me hitting myself, others, and objects out of anger and having emotional meltdowns. In adulthood, although I don't hit things anymore, I still have explosive emotions (anger and otherwise) related to ADHD and find it very hard to process and express them through words or helpful coping strategies and often breakdown, cry, withdraw from social situations, swing my limbs, engage in SIBs (self-injuring behaviors, such as hitting my thighs or gripping my fists very tight). With this, because the emotions are so big and with ADHD I have a shorter-term memory, it is very hard for me to express these emotions even after the fact. I have this as well with positive emotions, including engaging in SIBs. Outside of emotions as well, I'm very scatter brained but can sometimes focus in on the most minute things for hours or days on end, neglecting my basic necessities. I have a interest-based focus and things that don't interest me or serve a priority are very exhausting and taxing to do. It is very hard to get "invested" into something otherwise without instant gratification involved.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>In school, many teachers didn't understand my conditions to be able to properly accommodate me, and/or ignored my conditions all together. Although college is better than public K-12 was, I still face discrimination due to needing accommodations for these and have been denied them, against ADA. As I did well in K-12 generally, I was never granted a 504/IEP either despite showing great struggle at home with schoolwork. The biggest roadblock is the mental struggle of having to be without the accommodations because it is so difficult that I often break down emotionally from mental exhaustion. Outside of education, navigating social situations is difficult as I often get misunderstood for being rude because of my tone. Or being undermined for having "childlike" and "impulsive" traits related to Autism/ADHD. I have been socially exiled in my youth and adult life because of my neurodiverse behaviors. It is often hard for me to make eye contact, sit still, not bite my lips or fidget which give the impressions that I could be impatient, afraid, or even implying something</p>

	<p>sexual which is not the case. I also find it hard to navigate systems and paperwork due to the confusing nature of the setup but also due to my struggle with pattern literacy. I also struggle with somewhat of a speech disorder where I will mix consonants and often trip over my words, making it hard to say things clearly the first time and it taking it awhile for me to sound things out.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>I think it would be helpful to conduct studies by those who have similar conditions and on a variety of demographics. Much of the more significant studies on autism were done by White neurotypical (not having mental conditions) researchers on young White boys, when symptoms of autism and its co-occurring conditions appear differently in other demographics. Especially, without White neurotypical bias. This is especially significant as many girls, people of color, and adults go underdiagnosed and those who do receive treatment are treated with the intent to "fix" and not with the intent to support positive livelihood.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>All of the examples listed would be great. I wish there were more autistic-made resources available though and I could see more autistic providers as I feel they have a greater understanding of my condition, and I will have to explain less to be understood. Overall, however, treatment for autism is very VERY inaccessible, very costly, and incredibly skewed by neurotypical bias leading to misdiagnosis anyway. On top of those as well, there is an immense amount of stigmatization and I've recommended that many those suspecting they have autism NOT get tested due to the discrimination they can face (medical, disability in workforce, deportation from certain countries, etc.)</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I feel COVID-19 has only made it harder for autistic people to get treatment and care for co-occurring conditions. As from my perspective, prices have raised for insurance and treatment, and appointment availability has been horrendous making care much more inaccessible than it already was. It has never been worse, but it was already terrible before.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I feel it has made people more aware of their autistic behaviors and existence and really united the community. Especially in their co-occurring conditions. New research has been able to come out due to people self-isolating, allowing them to "unmask" (not hide autistic symptoms) and being more aware of their condition(s). At the same time, I feel it has made people painfully aware of how much our society does a disservice to people with autism and its related conditions. In general, there has been more individual improvement, but more mental exhaustion from society at large.</p>

Name	Brittany
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenge is expressing those conditions in a way practitioners hear, understand, and will follow through with. Because people with autism, including myself, sometimes express symptoms in way others dont understand - theyre often over-looked or minimized. Something my clients and I have heard a lot it "Oh, thats common for Autism" blaming whatever ailment on having ASD, with no desire to investigate.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge is expressing those conditions in a way practitioners hear, understand, and will follow through with. Because people with autism, including myself, sometimes express symptoms in way others dont understand - theyre often over-looked or minimized.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Interventions are generalized and applied indiscriminently across the spectrum. There is no distinguishing of support levels needed, or even change in modality.
What additional research is needed to help address co-occurring conditions for autistic people?	Adults need a greater representation in Autism research as well as assessing HCP's for their understanding in Adults with Autism experiencing Mental Health challenges.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Have MH interventions be 'evidence-based' for autism, not generalized to the majority and try to force autistics in that box.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Health services across the board are more difficult, many places lost funding, resources are strained or completely gone. This is a mess.

Name	Brittany
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenge is medical providers not having an understanding that everything is linked (I.e POTS and EDS impacts all systems and are not properly diagnosed nearly enough) misdiagnosis and inappropriate treatment plans from GPs who treat every system separately (GI, Neuro, musculoskeletal, Gynecological, etc.)
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	That because someone is Autistic it's assumed they should also have mental health challenges (I.e anxiety). Use of treatment plans that don't work for Autistic brains (CBT). Not recognizing the difference between Autistic Burnout and depression/anxiety disorders as both have very difficult approaches to care.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Outdated "supports" in school systems. Not being provided with appropriate communication devices/techniques early on. Believing that complex responses to unmet needs or overstepped boundaries are "behaviours" and creating cruel "behaviour support plans". Having higher expectations of how an Autistic person should act/react written into "treatment plans" than would be expected of anyone else.
What additional research is needed to help address co-occurring conditions for autistic people?	Any research that provides explanation that a co-occurring conditions is what it is and a "behaviour" is actually a stress or trauma response rather than Autism itself. This will lead the way in ridding the world of cruel and inhumane "behavior therapy" still seen as the normal practice today. It's scary how the general public sees these (I.e ABA, PBS) and think that this is a reasonable way to treat a developing child.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Literally everything. Rid all coverage/access to behavioural therapy and place that into accessibility to actual needed supports like OT/SLP for apraxia. Access to proper Autism education for caregivers (parents, guardians, families) provided BY Autistic sources to better understand. Mandatory upgraded education to any medical practitioner who support Autistic individuals.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Covid has actually improved a lot of Autistic's mental health because we as a society have learnt that work from home and hybrid options are actually very do-able. I'm not sure if it's from Covid (have had twice) or age but my POTS symptoms and shortness of breath have worsened the past few years. I have also been struggling more with swallowing (oropharyngeal dysphagia & aerophagia)
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	As per previous comment, a positive has been the implementation of virtual/remote options for appointments, school, and work. Not having the obligation to attend uncomfortable functions was also a benefit. I feel more Autistic people have been able to set better boundaries since the pandemic.

in-person social interactions and obligations)

Name	Brittany Daniels
Demographic	None Indicated
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	What about getting needed OT (occupational therapy), PT (physical therapy) and/or needed speech therapy covered under health insurance including Medicaid for autistic adults 21 years old and older?
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Brittany Shidham
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances - I can't figure out how to get my kids the sleep their bodies need. They just don't sleep well.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety - many people with ASD have high levels of anxiety which can be easier to notice than ASD. I showed signs of OCD from preschool age and was treated for that until my mid-30s when we realized I'm autistic. The ASD was missed. I noticed a similar trend happening with my kids but was able to help them pinpoint the ASD diagnosis to get them the best help for their self confidence.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Pathological Demand Avoidance (PDA) and other potential undiscovered tangential disorders - The UK and Australia have a robust understanding of PDA that's missing in the US. PDA is similar to ASD but has nuisances that leave these children and adults with misdiagnoses and few tools for support. I imagine there are other similar disorders that don't have a name - again leaving children, adults, and families without support. Strategies for ASD support can make PDA more challenging instead of helping.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for mental health support More availability of in-home services like speech and occupational therapies for children.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Brixton Moss
Demographic	Autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have POTS (postural orthostatic tachycardia syndrome), and I have noticed that many other autistic people do as well. I have had lifelong insomnia issues, a lot of problems with digestion when I was a child. I have always been extremely sensitive overall. I can feel everything in my body way too intensely all the time. I almost never feel “good”, I’m always uncomfortable and feeling something too much. I have a lot of sensory processing issues. I have to wear noise-cancelling headphones and/or earplugs (Loop earplugs, specifically) when I’m in public, especially places like grocery stores with a lot of ambient noise. I also have sensory seeking behaviors and stim, which helps the stress of sensory overload/“bad” sensory input. I’m not diagnosed with these, but EDS (Ehlers-Danlos syndrome) and MCAS (mast cell activation syndrome) are also extremely common.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There are few autistic people that are not living with a tremendous amount of trauma, because society refuses to accept and accommodate us as we are. We are also more prone to getting into abusive relationships and situations, which can also lead to trauma. I have C-PTSD, ADHD, MDD, PMDD, and various varieties of anxiety. I have tried antidepressants and ketamine infusions for my depression, but it’s still there. I’ve been in therapy for nearly a decade. I continue to find this world very hard to live in.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	We need to acknowledge the connection between autism, POTS, EDS, and MCAS. There is an undeniable overlap, especially in autistic women and AFAB people, who have been very misunderstood/ignored.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I hate that everything requires phone calls. I cannot make phone calls to access healthcare. I put this task on my partner, which I shouldn’t have to do. I know this is common among autistic people, and not just me. Services should be more accessible through apps like MyChart, texting, email, etc. Health care providers should be more aware of our comorbidities, and test for them once one thing is discovered. Most people that have the conditions I mentioned find out on their own, slowly realizing they have multiple conditions, when their doctors completely miss the signs.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I appreciate that we have more alternatives to interacting with people and going into stores. I like that we can have most things delivered, groceries brought out to our cars without having to shop for ourselves, and that work from home and online education is more common now. I don’t like going out in public for sensory reasons, and thanks to all of these things, I am finally feeling less burnt out.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	I mentioned that stuff in the previous question. I feel that the increase in remote services has been extremely beneficial for me. I dread the idea of things “going back to normal”.

in-person social interactions and obligations)	
--	--

Name	Brook, No Pressure PDA
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Demand avoidance affects all autistic people, especially when co-occurring conditions accumulate stress. Pathological Demand Avoidance especially needs more research to help clinicians differentiate between extreme demand avoidance that occurs during burnout and the unique neurotype of PDA.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of effective treatment, misunderstanding, judgment, isolation from community, parental guilt and blame when typical treatment plans don't "work"
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The lack of research into the different styles of demand avoidances cause confusion and stumbling blocks toward finding emotional regulation.
What additional research is needed to help address co-occurring conditions for autistic people?	As I've stated, clear research that explores what the PDA community has been saying for years: there are different kinds of demand avoidances, with different challenges. We need dollars spent exploring this as families are suffering.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, access to disability supports, awareness in the cumulative affects in burnout and functioning, how co-occurring conditions can mask unique struggles.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I do appreciate that it is more socially acceptable to school from home now. Families are seeing the benefit of being able to meet their kids unique needs at home with less stigma.

Name	Bryanna
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Underdeveloped fine motor skills Food sensitivities Sensory processing disorder Comorbidities such as Adhd or Ocd Insomnia Gluten intolerance Lactose intolerance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety Adhd Difficulty handling stress Conflicting symptoms Depression Difficulties finding meds that helps manage symptoms
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Stutter and other speech impediments Developmental delay in age (5 to 7 years behind)
What additional research is needed to help address co-occurring conditions for autistic people?	More therapists and psychiatrists with more knowledge and personal experiences associated with autism More autism friendly jobs and career opportunities
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Life coaches and supported/assisted living resources and programs
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Bryanna, self
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have Migraines, Dysautonomia, Postural tachycardia syndrome, Attention-deficit/hyperactivity disorder, Pervasive Developmental Disorder – Not Otherwise Specified, Attention Deficit Disorder, Depression, generalized anxiety disorder, level one autism, Asperger's syndrome, Obsessive-compulsive disorder, Post traumatic stress disorder, panic disorder, Rejection sensitive Dysphoria, Unspecified Mood disorder, Alexithymia, Oppositional defiant disorder, disruptive mood dysregulation disorder, Pathological Demand Avoidance, insomnia, parasomnia, dream-reality confusion, Body Dysmorphia, Polycystic ovarian syndrome, tachycardia, Pseudobulbar Affect, Premenstrual dysphoric disorder, Premenstrual syndrome, dyspraxia, sensory processing disorder, Avoidant/restrictive food intake disorder, pill dysphagia, Chronic sinus infections, Allergic rhinitis, Orthostatic hypotension, Metabolic syndrome, Insulin resistance, Mixed hyperlipidemia
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	being unable to hold down a job, being unable maintain relationships or friendships between peers or adults, suicidality, only one in four autistic people graduate from college.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	severe anxiety and self esteem issues, as well as depression eating disorders, and suicidal tendencies
What additional research is needed to help address co-occurring conditions for autistic people?	1.) there is no medication specifically for autism. 2.) autistics are more likely to be unable to finish high school. 3.) private schools discriminate and kick students out for having disabilities 4.) 75% of autistics do not finish college 5.) the mental stigma of the label 6.) autism speaks is a hate group 7.) more accessible public spaces 8.) sensory overload solutions
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	special education degrees being required to work with students with special needs, more insurance coverage, doctors have no idea what it means to be autistic, other forms of taking medication besides pill form or liquid form(for example Tylenol used to have a dissolvable strip that you could put under your tongue that was grape flavored), therapy being covered under medicare and medicaid, special education classes being required to be a doctor.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The Covid-19 pandemic has increased my anxiety to being around people being sick and has given me increased Dysautonomia, Tachycardia, and Postural tachycardia syndrome
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	increased remote work and use of Telehealth services have been magnificent with helping me with my ability to work however after 2022 those options started to disappear from the realm of possibility

in-person social interactions and obligations)	
--	--

Name	Caesar Augustus, Autist Advocate
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Bpd, ocd, cyclothimic d, traits, adhd impulsiveness and dysphoric dysregulation. Al dough I still live in a terrifying day to day due to sensory issues and social phobia my greatest challenge from co-occurring conditions is in this lifelong social disabling, which bans me from any kind of co-op on every project I've ever started (as an adhd they mostly never see conclusion 😞 anyway)
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	We tend to live in permanent depression, anxiety, somatic life threatening disorder, RAGE towards people (for being ever neuro typical noisy indifferent non solidaire people) to suicidality on later ages; (have in my skin a couple of this “;” 😞) From desperation and tiredness of ever fighting for everything, from communication barrier to facial and body language barrier and cero interest sharing to anybody nor cold-chat (cheap-chat) able Not counting spoon lacking from those “social interactions” and/or sensory issues, and/or internal ableism tensions
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Talking from my own exp... my developmental and intellectual disabilities are not as disabling or serious as the Autist ever enemy of life, communication, from the dullest, smallest of duties to the important business, we always lose chances, my personal score of communication success in sadly low and literally lost every important chance on the past and not seems to get any better or me any younger, just by that double empathy very Real barrier.
What additional research is needed to help address co-occurring conditions for autistic people?	We need to know about a lot of things of course, NOT for autism screening for eugenic birth control like some places are doing today 😞 but for making accessible in real world to all of us the gift of brain functioning at functional rates, adhd meds are life changing and those must be accessible as a human right, so price must be accessible or state financiated, meds state occultation due to stimulant drug addict craving is leaving the really needy serious user at despair. Cannabis thc and cbd, both and other terpenes must be in study for adhd autistics in serious big budget studies on functional-mri at during, after and before, measuring basal and on duty mind states, we must have more information, again, due to drug addict craving we as socially disabled people are left at despair.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need trauma treatment as first approach on public services which is long lasting, multidisciplinary and performed by a team, on that matter state doesn't pay for any longer than a couple weeks, like giving aspirins and two days license to shellshocked soldiers on the sixties all over again. Not saying fast therapy, mindfulness or cbt is not useful, it's not useful on us, experts already on ever dissociating from overwhelming environments and body callings, we don't need to reconnect to the environment but our own body and our subconscious crying for help through self awareness and trauma reconnection, say long term therapy from neurodiverse trauma experts, only ones with truth empathy.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Among already spoken health issues are the bodily ones, like the very common concurring of iron deficit syndrome for life, the autistic celiac disease which includes serious issues with dairy, egg calcium causing internal non visible chronic disease like permeable intestine, psoriasis and adult acne, migraines, mood disorders, chronic articulation pain (very similar to arthritis), all of this debilitate the person to points of break where an

	<p>opportunistic infection like a respiratory one like covid takes a high life threatening toll on us, vaccinated or not.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>As an outside ever alienated citizen, tele socialising and tele schooling, even tele working and self tele employing is the VERY BEST thing ever to happen as a reasonable adjustment we (I) needed from 20 years ago. I will ever keep saying Covid lock down and all post keep safe protocols saved my life.</p>

Name	Caitlin
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Doctors are unfamiliar with co-occurring disorders and can be dismissive of autistic individuals self reported symptoms. Our family struggles with gastrointestinal issues which impact our ability to participate in the community. SLEEP IS HUGE. It impacts every facet of life. It is so hard for us to get good sleep. I have spent HOURS trying to find a doctor to listen about my 4yo lack of sleep. No one wants to prescribe anything due to her age. So our family is left not sleeping. This means missed work and school and well as impacts our general health.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is huge in our household. It impacts us all significantly. It interrupts sleep, nutrition, and bathroom usage. Our daughter fits the profile of pathological demand avoidance. Our day is full of anxiety. It runs our lives. Everything from putting on clothing, eating, using the bathroom, sleep, taking medicine, getting in the car—EVERYTHING in our life revolves around our 4yo anxiety. We need help. We are drowning. No health professionals take us seriously. They are dismissive and lack understanding. Help us please.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Pathological demand avoidance needs more attention in the US. We are drowning as parents. Health professionals and educators do not take our needs seriously. They lack understanding and often empathy for our situation. Our child appears “normal” outside of the home. She comes home and falls to pieces. She doesn’t sleep. She won’t use the bathroom. She cannot leave our side. She is suffering. We are suffering. Help us, please.
What additional research is needed to help address co-occurring conditions for autistic people?	Pathological demand avoidance needs attention in the United States.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The costs of services for my children are outrageous. We hit our out of pocket maximum very quickly each year. There are waiting lists for everything including financial support. We are drowning. Our children deserve better. There are no services for adults. There are waves of parents figuring out that they are autistic as they learn more about their children. There should be far more options to support us, though life and parenthood. We need more occupational therapists familiar with autism in adults. We need more support groups. We need more community support.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Autistic children and adults are at a far greater risk for developing long covid. More research is needed to learn how this will present and how it could impact someone through their life. More information is needed and resources are needed to stop the spread of Covid in ABA centers. Surgical masks aren’t enough.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Calen
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I struggle with fine motor skills and I am easily overwhelmed by loud noises and bright lights
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have always struggled with anxiety, depression, self harm, and multiple suicide attempts throughout my life
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I don't have any other co occurring disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	autistics and suicidality, causes + solutions
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	free healthcare for everyone, increased disability awareness + acceptance, research + policy led by people with autism and supported by neurotypical people
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	expanded access for telehealth + remote work, contactless delivery

Name	Cali Hayes
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Connective tissue disorders. Gastrointestinal problems.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA. ADHD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication struggles. Emotional regulation challenges. Sensory issues.
What additional research is needed to help address co-occurring conditions for autistic people?	I would love to see more research on PDA (Pathological Demand Avoidance). There is not enough official information out there.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better education and training for professionals who work with autistic people. Broader insurance coverage to access diagnosis, and more professionals able to diagnose. Currently very few places accept insurance for evaluations and many have them have multi-year wait-lists.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive: Increased accessibility of communication, work, and service options. Increase in remote work, online school, online communication, and alternative school offerings. Negative: Significantly longer waits for medical and mental health support. Much harder to find and access care.

Name	Cali, Worker/Student
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	a big problem i have is that autistic people experience pain and sensory stuff differently than other people and i've never met a doctor informed in how to treat me as an autistic person. for example: i had very rare chronic appendicitis and they thought i was dehydrated for 5 years when i was experiencing what some people call the worst pain of their life
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	i've attempted suicide 3 times. 16 having emotional outbursts and migraines from overstimulation. it started affecting my grades. parents weren't happy. When I stopped being successful they weren't so forgiving. I felt shame in losing my one good quality. The more I tried to improve my grades the worse i got. distress led me to attempt suicide during a meltdown. 18. was being bullied. I was away from my abusive family but everyone around me still hated me. & i tht they should. i had to be a bad person if so many people agreed. No money for therapy, so i decided to do the world a favor My last attempt was this year. been in therapy regularly. was diagnosed with autism. I had developed an understanding of myself and challenged my guilt and shame. But new problems presented. I had to confront that autism means being disabled. The future that was promised to the able-bodied is not promised to me. I am unable to work like other people w/out relapsing into painful meltdowns and self harm. So I have to work less. When I work less I cannot afford my rent or medicine. When I work more my mental health declines rapidly towards the suicidality that i've worked so hard to move past. I didn't want to live my whole life like this, always exhausted, always in pain, fearing homelessness, fearing starvation. nobody to help me. i'm scared. death had to be kinder to an autistic girl than life. Came close this time. In the past 2 years i've lost 4 people to suicide. they were all autistic.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Autism in adult, autism in women, autism under capitalism. autism in the 40 hr work week, autistic disease v allistic.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	1. govt paid for therapy 2. real labor rights protections for autistic people 3. improvement of currently disability aid 4. Required in-school education about autism 5. Requiring autism informed and educated medical care.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	A bad one. covid has seen massive skill regression which has caused higher autistic unemployment and lower graduation rates
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
--	--

Name	Callista Markham
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	In my experience the most challenging co-occurrences are with Ehlers Danlos Syndrome. The condition when combined with neurodivergence are crippling, that initiates a cycle of pain and inflammation that drastically decrease movement and negatively effect digestion to the point that I would rather starve than make myself food. In addition to EDS, POTS makes physical exertion almost unbearable. Having communication deficits increases the potential harm of both of these by not being able to properly communicate needs.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant issues caused by co-occurring mental health conditions are; depression that makes wanting to stay alive a constant and demanding task requiring a lot of mental stimulation and support, anxiety of being perceived that dictates actions, movements and thoughts, OCD that makes already physically and mentally demanding tasks even more so, and ADHD that works directly against autism demanding novelty while autism demands consistency.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	There must be more research done on AFAB individuals as well as adults with autism. There are little to no good or helpful resources for struggling adults with autism, let alone help for any co-occurring conditions. There also needs to be a concentrated effort in research about the treatment of individuals affected, and mental health.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Providers need to be more educated on autism in general and how to be accommodating. It would also be prudent to have better communication accommodations for anything health related like having text based options for dealing with providers. There need to be more services in general, and they need to be created with autistic people, not just allistic people and not with just one or two autistic consultants.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The onset of the pandemic is when I first lost my job due to overwhelming anxiety that led me to discovering that I was autistic. Since then I have terrible anxiety every day because of the laxity of public restrictions and overall neglect in my part of the country. Knowing that COVID-19 could further disable me while still not receiving the help and accommodations that I need paralyzes me with dread.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think that the pandemic has mostly affected positive societal changes in my life, with concerted effort to make modified communication more accessible and acceptable than ever. I think work and school should be more disrupted by health and environmental factors than it is.

Name	Candice
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gaslighting from medical community because of communication differences, stereotypes and lack of education on neurodiversity.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression from seemingly haven done all the correct steps demanded by society only to be still ostracized and treated poorly by most people for just existing.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	With a spiky learning profile it's hard to get adequate supports since you excel in some areas but need a lot of support in others. Also with daily challenges changing capacity it leaves many without support or being believed that they need support.
What additional research is needed to help address co-occurring conditions for autistic people?	Whole person, trauma informed and ND affirming medical centres maybe? So often when looking for support we are misdiagnosed, gaslit and told it's all in our heads. If there were a place with trained professionals who cared about patients and wanted to help them live their best lives. Mental health, physical health and community programs under one roof who all communicate together cutting red tape for patients.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	No autistic programs without autistic people being a part of the process to ensure we aren't forcing theoretical strategies based on stereotypes. Care given to those who need it without waiting years to prove a diagnosis because insurance companies say that's the way it has to be.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Personally my health has declined as my child's mental health is struggling. We saw through the pandemic that we don't have to be forced into environments that take all of our energy just to satisfy societal pressures. Life has gotten harder but so much happier knowing ourselves and getting to know the neurodivergent community. We have never met such an amazing group of welcoming and non judgmental humans as we have since discovering our autism and adhd. Knowing that you aren't a broken human and only wired differently helps to get through the hard days. The biggest struggle is ableist attitudes and people who would rather make assumptions and be mean to one another than to try and understand and show compassion to a story that seems so unbelievable to you.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Our life has turned upside down since the pandemic. Trying to endure the distance learning and covid scares/tests increased our child's anxiety and getting back to public school has led to burnout twice now. We are on waiting lists for an autism assessment and have been about 2 years now. We

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	now once again rest to heal our child's nervous system since the school couldn't support her properly and we had no proof of her struggles on paper.
---	--

Name	Carey Holm
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal, mental health, sensory processing, motor challenges, sleep disturbances. These all effect my son and the lack of research and provider services for a person effected is completely unacceptable.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Mental health (anxiety, OCD, attention, aggression)
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Intellectual disability, communication disability, learning disability (dyslexia, dyscalculia, dysgraphia)
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More providers that are educated and experienced in care of individuals effected by the most challenging co-morbidities of Autism (physicians, dentists, mental health, gastroenterologists, neuroscientists, and care providers)
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Covid 19 lockdown brought on highly aggressive and OCD behavior that has continued to this day.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruption of speech and occupational services caused regression of years of gains. Social isolation and tele-health has caused extreme anxiety when we now visit in person. Missed years in school instruction do to inability to tolerate online education.

Name	Caroline Rodgerss
Demographic	Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	<p>Most health issues co-occurring on the autism spectrum inspire compassion in the community at large. An exception is the higher percentage of people with autism who experience gender dysphoria. Gender dysphoria can make them targets of harassment and discrimination, making it even harder for them to create successful lives. People with autism are three to six times more likely to experience gender dysphoria than the general population (Warrier V, Greenberg DM, Weir E, et al. Elevated rates of autism, other neurodevelopmental and psychiatric diagnoses, and autistic traits in transgender and gender-diverse individuals. Nat Commun. 2020 Aug 7;11(1):3959.) The same study found a higher incidence of gender dysphoria in people with ADHD, depression, and learning disabilities, each of which co-occur in people with autism at a higher rate than in the neurotypical population (Medical Conditions Associated with Autism Autism Speaks), suggesting that these conditions may have a shared etiology. In contrast to the groundswell of community support inspired by autism, the debate over gender identity, care, and treatment has become an explosive political issue throughout the country. While it can be argued that the increase in people who do not accept their birth-assigned gender is due to increased tolerance, support and services, the possibility that some portion of its existence is a consequence of gestationally induced epigenetic changes cannot be overlooked.</p>
What additional research is needed to help address co-occurring conditions for autistic people?	<p>People with autism have a higher co-occurrence of health conditions such as ADHD, anxiety, depression, epilepsy, GI conditions (Medical Conditions Associated with Autism Autism Speaks, and gender dysphoria than the population at large (Warrier V, Greenberg DM, Weir E, et al. Elevated rates of autism, other neurodevelopmental and psychiatric diagnoses, and autistic traits in transgender and gender-diverse individuals. Nat Commun. 2020.) These co-occurrences provide researchers with a potential Rosetta Stone for understanding the mechanisms at work. Since current understanding of DNA explains only a fraction of these conditions and many are early onset it is possible that they share a prenatal etiology. Since DNA alone does not explain the conditions, epigenetics – a term that encompasses a variety of DNA methylations, histone modifications, and RNA silencing that affect gene expression (Kanherkar RR, Bhatia-Dey N, Csoka AB. Epigenetics across the human lifespan. Front Cell Dev Biol. 2014) -- may provide the key. It is these</p>

	<p>chemical occurrences at various and specific locations on DNA that are the likeliest cause of phenotypes and health issues that cannot be explained by DNA alone. It would be worth revisiting whether certain obstetric practices unwittingly cause epigenetic changes during labor (Rodgers CC. Continuous electronic fetal monitoring during prolonged labor may be a risk factor for having a child diagnosed with autism spectrum disorder. Med Hypotheses. 2020.)</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	

Name	Carolyn Holston , Democrat
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I worked as an aide for the teacher of this 1 child. I worked with him directly for several weeks. The way that the program was set up, I engaged him, & she observed, most days. Then he went home early & she & I would discuss what we thought. He would only speak in quotes from Disney movies. I would try to point out other things that had nothing to do with those movies. The family had 3 other children. I felt like he got parked in front of a tv a lot. It was like he was talking to the only people who "spoke" to him. Just a feeling that I got. He ended up permanently institutionalized. I'm not sure that we could have reached him.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	All of the above come into play at any time.
What additional research is needed to help address co-occurring conditions for autistic people?	I would look at the numbers of those people, & distribute the funds equitably
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above. There are many safeguards to eliminate fraud.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	As COVID only continues to mutate, fear. It depends on their ability to understand that.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Routine is often quite important to many on the spectrum. It was more traumatic to them than us, if they didn't understand why they just couldn't go to the store.

Name	Carolyn T
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges caused are through the lack of consideration of these conditions and resources to foster inclusion or assistance.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenges caused are largely based on the male-centric evaluation process; the mere presence of a co-occurring mental health condition has the ability to lead to misdiagnosis, late diagnosis, or no diagnosis – all of which are hard to traverse and lead to improper treatment, whether it be medicinal trials to see “what works” or a lack of supportive services because the individual didn’t present as autistic in a certain way.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Again, the most significant challenges here are in the lack of services for all individuals, and professionals capable of providing said services.
What additional research is needed to help address co-occurring conditions for autistic people?	To fully understand autism and co-occurring conditions, research must be conducted on a larger, more inclusive scale. As an adult, I have been able to identify as autistic through resources provided by other countries, but I am unable to obtain a diagnosis because the “experts” don’t work with adults.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autism services and supports require more experts to be able to provide proper and quality care. There should be universal healthcare for individuals with autism so that they can continue to receive care should they become unemployed, or otherwise lose coverage. Also, there should be options provided to accommodate the comfortable communication level for people on the spectrum (ex: My dealership has texting so I could ask questions and not get overwhelmed.)
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Like many neurotypical individuals, COVID has effected both physical and mental health in individuals with autism. It caused a disconnect within safe communities, changed routines for those who rely on them, put immunocompromised at risk, and I’m sure over all caused fear and possibly took the lives of their loved ones/ care takers.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	While remote services may benefit some, increased remote interactions have also lead to isolation and probable depression in individuals – these aspects are not inherently related to the autistic community, but this community is more vulnerable to change and emotional dysregulation which could lead to self-harm or suicide.

Name	Carolyn, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenge are behavior related issues associated to Pathological Demand Avoidance. More definition and explain on ways to support these nervous system issues and greatly needed.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and aggressive behavior associated to PDA
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication and social anxiety
What additional research is needed to help address co-occurring conditions for autistic people?	pDA needs its own research and DSM evaluation and diagnosis
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for more modalities of therapy and education with the schools.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The anxiety relating to social interactions suffered. They lost skills and have reverted to connection through screens.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The lack of qualified experts and technical service providers have created long waitlist and delays in getting services. Medication shortage is by far the worst part for kids that need the meds.

Name	Caryn Cramer
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep deprivation. Also, when the PDA profile of autism is involved, it overrides a person's ability to eat, have hygiene (bathe, brush teeth, etc), toileting, be properly clothed, have basic needs and safety
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For PDA autism profile, all of the actual "demands" expressed through language as well as energetic and perceived /felt demands mean 70% of autistic PDAers can't access a school environment. it would be extremely helpful to do teacher trainings about declarative language and develop school programs that work to keep PDA autistic people able to handle a school environment. a lot of educators are aware of the sensory needs of an autistic person, but considering that PDA affects about 20% of autistic people, we need to have more awareness about what is perceived as a demand to them - as it sends them into nervous system activation/limbic system. We can train teachers and schools to work with this nervous system sensitivity/disability
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	PDA autism profile can lead to severe nervous system activation - it affects about 20% of autistic people, so it's a very common comorbidity. It can be debilitating and even harmful/unsafe if PDAers are not accommodated to keep their nervous system regulated/ stay out of fight or flight mode. Lowering demands for students (use of declarative language and more self-guided learning), would help them in both school and career - and greatly help their quality of life overall
What additional research is needed to help address co-occurring conditions for autistic people?	We need more research about PDA and autism. it affects one and five autistic people, so it is one of the most common comorbidities. And 70% of PDA kids cannot access regular school because it is too demanding on their nervous system. It's a serious issue that we need to put attention and resources into. Lowering demands through language style and teaching style and classroom environment would help these children greatly.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Parents of autistic children do not have a good enough financial system to help them cover the costs of therapies. we need more programs to help parents of special needs children pay for therapies. Health insurance often puts very arbitrary caps on what they will reimburse, etc. so the true cost of being a special-needs parent is very high, and there are some services that wouldn't fall under the scope of the OT or the SLP at a school - since school services are focused on helping kids achieve in an academic setting. There are many children that need more well-rounded life skills that would come from other therapies outside of the school. it would be particularly helpful to cover DIR Floortime!!! This method has extremely good results, far outperforms ABA results, is healthier psychologically for children, and teachers children skills in a way that helps them generalize and grow
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Casey Foster
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders can cause alterations of blood sugar levels leading to behavioral challenges as well as risks for other associated health complications. Sensory challenges associated with diet may make having a balanced diet more difficult and often there is increased cost burden to accommodate food related sensitivities. Sleep disturbances can affect relationships, place additional burden on care givers, and cause challenges with blood sugar levels and other dietary difficulties.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Co-morbid ADHD and its associated rejection sensitivity dysphoria place additional mental strain on autistic individuals and their care givers. Anxiety associated with OCD is a very difficult challenge to parents and care givers as well as the autistic individual. Depression can result from unaccommodated anxiety and RSD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Non-typical communication styles and un-recognized common social constructs make it difficult for Autistic individuals to be accepted by allistic individuals
What additional research is needed to help address co-occurring conditions for autistic people?	Greater teaching of social, emotional, learning to the general population and how it impacts the acceptance of autistic individuals.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased telehealth and remote work during and after the pandemic have made the world easier for neurodivergent people at large.

Name	Cassandra Mccarthy, Self, diagnosed Autistic
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Public spaces are often too stimulating in both a visual and auditory manner. I rapidly become overstimulated, leading to extreme agitation, lack of focus, and headaches.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My autism exacerbates my already existing severe problems with anxiety and depression, as well as my ADHD. Being overstimulated rapidly uses up my energy because it causes me to get anxious very quickly which prompts frustration which prompts exhaustion. My memory issues from the ADHD are also often exacerbated by my autism's extreme need for a consistent routine. When I can't remember or focus on my daily routine, I get more stressed out and more dysfunctional. When all of this accumulates into an autistic meltdown or shutdown, I inevitably wind up completely drained of energy and burnt out, which triggers a severe depressive episode. It also often interferes with my sleep because my brain is too active to quickly go to sleep without pharmaceutical aid.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	As stated before, my autism intersects hard with my ADHD. The symptoms of both often clash in such a way that I spend a lot of my time at a severe rate of dysfunction.
What additional research is needed to help address co-occurring conditions for autistic people?	More research into effective treatment methods, more research into effective support methods, more research on how to communicate with autistic people, and more research into how to teach skills and knowledge to autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Everything. For one, it NEEDS to be made far easier to apply for and get onto SSI/SSDI when you only have developmental disabilities. It should not be the case that something like nine out of ten disability cases get turned down because judges hearing our cases think that our lack of a 'visible' disability means we are either lying, exaggerating, or faking it. More doctors, dental, and psychological/psychiatric professionals also need to receive mandatory training on how to work with autistic patients. Far, far too many professionals have dismissed me, manipulated me, or written me off the moment I told them I was disabled. Anti-discrimination protections in employment need to be more codified, too, because I'm at the point where I refuse to willingly divulge my disabled status to potential employers because I KNOW they will turn me down for a job, or fire me if I already have one. And they'll get away with it, because burden of proof is on the autistic individual, and proving discrimination in hiring/firing is nigh impossible as it is.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Personally speaking, being forced to work through the pandemic to support my family was traumatizing. It has permanently impaired my ability to seek further work because I spent a full year at minimum having to risk my life working with the public every single day because I knew I wouldn't be able to get approved for disability insurance so that I could quit my job and take care of myself properly.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>There was temporarily a positive change in that remote work became normalized, but that positive change is rapidly disappearing because executives are trying to force everyone back to the office, which is eliminating a lot of remote work roles.</p>
---	---

Name	Cassandra Rooney
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenges faced are both within and outside the home. Having a child with comorbidities makes it harder to determine which behaviors/ conditions to manage first, as well as what strategies to use based on said comorbidities (ADHD vs Autism vs PDA vs treating for sleep apnea). Outside the home, the challenge is the constant educating of other people about Autism/ADHD/PDA and dispelling incorrect information of such.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The challenges are the same as mentioned in the first question: figuring out which to treat first, and finding mental health professionals that are knowledgeable in autism vs professionals that are misinformed.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more research on the co-occurrence of ADHD and Autism. In addition, more research is needed on information regarding PDA (pathological demand avoidance). Lastly there needs to be more research on the biological/hereditary component of autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The supports and services offered within the public school system needs major improvements for the needs of children with co-occurring conditions.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Quarantining during COVID severely impacted the development of socialization skills for children with comorbidities, especially within early childhood. Continuously getting sick thereafter has impacted the ability of autistic people to function at their highest potential, in addition to missing school and/or work.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The reduction of in person health appointments, increased use of zoom meetings for school, and the inability to get needed services greatly affects children who are in desperate need of in person health services, schooling, and physical/occupational therapy.

Name	Cassandra Stanolevich, Mother of autistic child
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	1) There is the issues of reoccurring ear infections, resulting in several sets of ear tubes, or the concern of it turning to a staph infection..Im speaking from experince. 2) Child having nerve pain. 3) Another issue is GI problems. 4) Being nonverbal, having to have speech therapy, OT as well 5) ADHD/Anxiety 6) The issues of elopement are very scary for a parent. 7) Sleep issues, Sleep Apnea
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggressive behavior, anxiety, ADHD, and now self injurious behavior
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Trying to make sure that my kid has a updated IEP for school along with a behavior plan.
What additional research is needed to help address co-occurring conditions for autistic people?	Reaching out to families and individuals to ask them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance not covering aba therapy or a special bed for a child.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Therapist were not able to work with your child. Having to stay home with kids and help them work from home. And reduce interaction with others

Name	Catherine
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastro and toileting issues are the biggest challenges for us
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	We experience the world so differently, and we are not understood or given consideration or empathy
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	We can't put our feelings into words, so we can't begin to describe how we're struggling
What additional research is needed to help address co-occurring conditions for autistic people?	Speak with parents of autistic children, guaranteed they know more than the 'experts'
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Supports must be more readily available for lower income families
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	We are not 'allowed' to visit the doctor when unwell anymore, and cannot afford mental health support
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Being isolated when you already have a tendency towards shutting yourself off socially is damaging to the psyche and can be extremely hard to break

Name	catherine martell
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	sensory and motor challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	suicidality, social phobia
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	learning disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	how to change attitudes so more accommodations are voted for.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	medicare expanded to include dental, vision, and hearing FOR ALL.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Catherine Nimmons, Parent of a child with autism
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Self injury behavior
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self injury behavior
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Intellectual disability
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More response or awareness and more support for parents of a child with profound autism who have self injurious behavior. More support is needed for parents
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Affected education. Our daughter was home for 6 months. Was a nightmare
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth is used way too much. People with profound autism don't respond well to telehealth

Name	Catherine Slocombe, Mother
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has had gastro issues most of his life. He also has sensory challenges, mostly that he does not like anyone too close to him. He also has to have socks on at all times, and will not go barefoot.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son has all of it. Besides the Autism, he has severe Anxiety, Depression, OCD, ADHD, Self-Injurious behavior and Disruptive Mood Dysregulation Disorder. He stabbed himself a few years ago, hits himself in the head and pounds his fist on tables and in walls when he is angry or upset. He can't control his behavior and it can come on suddenly. He talks to himself constantly. We are senior parents and he is 28. We don't know if he can ever fully take care of himself in life. He cannot get a decent job because he can never get past the interview, even though he is smart, been to college and has a skill. Speech/Language and communication has always been a problem for him. ADHD causes him to not focus and getting him to pay attention is difficult. All of these conditions impact his life on a daily basis and have only gotten worse as he ages.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	He has a hard time communicating, finding the right words he should use. Speech/Language therapy all through school helped somewhat, but he still struggles even today.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Help finding a good job should be priority. We are working with the Dept of Rehabilitation, State of Michigan. It is a joke! He completed his schooling in September and got his last Certificate he needed. This is February, and he still does not have a job. His counselor went on leave, then the next person took over. He had a few mock interviews with her, and then she went on leave. The next person took over, and all he is doing is sending him jobs that he finds on Indeed, which we could have done ourselves. The system is ridiculous! My son has been on Social Security Disability on/off for many years. He applied again, but he was denied. Then he lost his Medicare insurance. Now he has to work a part-time job he hates, just so he can have health insurance. All these people should have health insurance provided to them. They suffer every day with all these co-occurring conditions, yet they are not eligible to have Medicare. They said my son's condition has improved. He has only gotten worse. Does someone who stabbed himself sound like his condition has improved? They don't care. They only see that he has a job and can work. That's all they care about.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>An increase in telehealth is a problem. My son has had therapy for years, but it has done nothing to help him. He needs, and wants, to have therapy in person, but nobody does that anymore.</p>
---	---

Name	Catrina
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep Disorders Gastrointestinal disorders Sensory POTS Ehlers danlos syndrome PMDD
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Suicidality Anxiety Depression ADHD Self-injurious behavior
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities and developmental disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	More research into how autism and all co occurring conditions presents and affects the lives of women, afab and bipoc people in general. How ADHD medication affects AuDHDers compared to ADHDers Who in the autistic community is affected by co-occurring conditions and what treatments, therapies, and accommodations help improve quality of life.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More help for autistic adults Access to healthcare for everyone More education into autism and its co-occurring conditions to general practitioners, nurses, surgeons and doctors. We are sometimes not believed when we describe our symptoms or tell a doctor we believe we have a certain condition because they are unfamiliar with both autism and its co-occurring conditions. Autism advocacy in doctors offices and hospitals from people who are autistic or at least have an understanding of autism. More protections for autistic people. Mothers are afraid to disclose they are autistic because they don't want to risk losing their children. Autistic people are also underestimated and neglected as parents, patients, and employees.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation from lockdowns had a lasting impact on mental and physical health. Depression and anxiety remain high. Covid still causes a lot of illness and is unpredictable in how it affects anyone. But co-occurring conditions can make autistic people more at risk. Unmasking at home and late discovered autistics are having trouble integrating back into society now that there is a push to return to normalcy. Sensory difficulties are more difficult and old coping mechanisms are not working. Lack of insurance creates barriers to therapy and other services.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	Positives: reduced in person interactions, virtual appointments, increased access to remote work and school Negatives: More sensory overstimulation, unmasking complications, people are less likely to be understanding of social and political differences after the political conflict over the pandemic and other policies. The world feels less safe. It is harder to trust people.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Celestine Cookson
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep issues (insomnia, delayed sleep phase syndrome, restless leg syndrome, etc), Ehler Danlos Syndrome and other connective tissue disorders (VASTLY underdiagnosed), chronic pain, sensory issues, POTS, PCOS, PMDD, Mast cell activation syndrome, motor challenges tied to EDS and hypermobility, muscle differences resulting in issues with gait, breathing, strength, back pain, joint issues. None of these issues can be separated from the massive rated of co-occurring issues related to complex PTSD and somatic expressions of various additional mental health struggles, including dissociation, nervous system sensitivity and regulation issues, etc.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD. Lack of diagnosis resulting in suicidality, anxiety, depression, substance abuse, and vast amounts of complex PTSD often as a direct result of lack of diagnosis, education, and appropriate support. Most Autistic individuals endure vast amounts of trauma due to lack of diagnosis and education in the medical and mental health fields about Autism and what it actually is. For women and girls, they are frequently misdiagnosed and put on inappropriate medications than can cause long term damage. Even with proper medication for co-occurring mental health issues there are insanely high barriers to getting access to their appropriate stimulant medications (most Autistic 40-60% people have co-occurring ADHD) which is incredibly challenging to get prescriptions filled due to laws around schedule II drugs, lack of informed and appropriate providers, cost, etc.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning, developmental, and communication disabilities. Autistic people require clear, direct communication and do not communication or often read subtext. This wouldn't be a challenge if the majority of the population did not avoid direct communication. The have cognitive processing differences, such as primarily bottom up thinking patterns that can take them more time to process new information or adjust to changes. Most Autistic people have learning or processing disorders, including dyslexia, dyscalculia, dysgraphia, auditory processing disorder. They can also experience different needs in order to learn most effectively. Developmental disorders can vary certainly, but issues around interoception, proprioception, can impact walking, crawling, and fine motor skills. Many autistics have a high tolerance for physical pain, but heightened sense of pain related to other sensory issues (heat tolerance).
What additional research is needed to help address co-occurring conditions for autistic people?	The BH4 pathway and co-occurring disorders, including have Autistic people have issues breaking down various vitamins and chemicals in the body. Autistic females especially have extremely high rates of CPTSD, and some studies have shown rates as high as 90% for those who have experienced sexual assault. Research is fine and good - but we need adequate and appropriate funding and support. Better education for parents, educators, medical providers about identifying and screening for autism. This is especially true for those who tend to fall through the cracks, especially girls, those with higher than average intelligence, hyperlexia, and heightening states of emotional sensitivity and empathy.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage should be guaranteed lifelong for all which includes the following treatments: -Patient advocacy services or support workers (for making phone calls, addressing daily tasks that are especially draining for autistic people) and in help navigating anything related to the legal system, education, employment, insurance, taxes, or highly bureaucratic systems. - Access to providers who are trained appropriately in trauma informed care and working with Autistic people including Occupational Therapy, Speech

	<p>Therapy, Physical Therapy, Chiropractors, Massage, Rheumatology, Geneticists, Gastroenterologists, Neurologists, Psychiatrists, Therapists. - Improve access to services that don't require phone calls, but offer texting/email options, including online scheduling, with more forgiving cancellation policies. -More options to include telehealth and inter-state access to providers as possible, especially mental health providers. -Require providers to stop providing ABA therapy. It's been shown to be harmful and have long term side effects and only encourage autistic masking. -Greater community supports for Autistic people that includes mutual aid and social supports. -Education systems and plans that have adequate providers for testing, providing appropriate accommodation and support plans in school which also factor in social supports.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Vast amounts of Autistic people with comorbid disorders (which is all of them) have suffered increased issues related to long Covid, and increase activation of morbid disorders related to having had COVID infections. This includes worsening sleep issues, executive functioning struggles, worsening depression and anxiety. This also is greatly tied to more physical issues related to increase fatigue, chronic pain, memory issues, and activation of various disorders including POTS, PCOS, food intolerance, and immune system issues.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Greater access to remote access to services, including work/school have been especially useful. However many services are no longer being covered. This includes getting access to stimulant medication which requires in person visits again after the COVID 19 emergency measures expired. Increased access to services that allow for delivery or decreased social interaction have been useful, but are often very expensive. The disruption of routines and coping skills has been both positive and negative. Many undiagnosed Autistic people have begun self-identifying due to the disruption and getting supports. However getting diagnosed is time consuming, expensive, often comes with long wait lists, and many providers who are not appropriately trained or qualified to diagnose high-masking adults, women, BIPOC, and people with extensive trauma and other cooccurring conditions. Many Autistic people have sought out testing and diagnosis to only be dismissed and increased experiences with trauma from medical providers dismissing their experiences.</p>

Name	Celine Fortin, The Arc of New Jersey
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Co-occurring physical health conditions add another layer of complexity to the challenges already facing those with autism. Appropriate diagnosis is challenging, leading to misdiagnosis or a person with autism not getting the appropriate treatment. They may experience pain or discomfort which makes it more difficult to complete everyday tasks and if their expressive language skills are poor they may not be able to convey how they are feeling. Undiagnosed issues can lead to significant health issues later. Certain issues like sleep disturbances disrupt the entire household and can affect a parent's ability to work or care for other household members.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many people with autism have co-occurring mental health disorders. It is extremely difficult to find specialists to properly diagnose and treat them. Traditional forms of treatment need to be modified or new treatment models need to be developed to be effective. My son with autism has been diagnosed with depression, anxiety, PTSD, and OCD. The anxiety is the most debilitating condition he faces. It is so severe he can not leave the house. No professional we have consulted has been able to treat him effectively. They either don't understand autism and how it affects his ability to participate in treatment, or they don't understand the unique way he processes his anxiety and depression. Another issue is that individuals with autism and co-occurring mental health issues are often found not eligible for traditional IDD services such as housing or employment supports. The individual is shuttled back and forth between IDD services and mh services with neither one taking responsibility for their care.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities make it very difficult for people with autism to participate in treatment modalities addressing mental health challenges or to inform their health care providers of issues and concerns. Therefore many co-occurring conditions go undiagnosed and/or untreated.
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more specific research on effective treatment modalities. There also needs to be more effective methods for communication to help people with autism better express their issues and concerns. There also need to be a better integration of systems - IDD, mental health, physical health and behavioral health systems working together to develop and provide holistic care.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above mentioned examples would be beneficial. There also needs to be increased cross training of professionals across systems as well as increased services overall.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Unfortunately the pandemic has isolated people with autism even further than before. Individuals who experienced anxiety regarding social situations became even more isolated and now have an even more difficult time interacting in social situations. Also, anxiety over getting sick still keeps many people at home. If they are not utilizing hard won skills they are losing their abilities to communicate and participate in everyday activities.

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Thank goodness for telehealth. My son would not be able to have any health or mental health appointments without it. It is still limiting as his communication skills are poor but it is better than nothing.

Name	CFT
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Can't speak for the majority, but based on personal experience and clinical observation, concurrent conditions with ASD create diagnostic complexity that causes some professionals to misdiagnose individuals (as in, diagnostic overshadowing). Concurrent conditions create the opportunity to do things in different ways than others, but they also create problems of feeling more physically and mentally exhausted, and misunderstood by others.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I'd say my response is the same as the prior question. Additionally, an internal sense of disconnectedness from others due to feeling so complex and different.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Again, same response as the prior two questions, with the addition that the combination of these conditions can lead to feeling incapable, condescended to, left behind, inferior, inadequate, and frustrated in a world that is not accessible to us.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on a greater variety of overlapping conditions. For example, survey of Autistic people about their concurrent conditions). For instance, my unique assortment of conditions is: Leber Congenital Amaurosis / Cone Rod Dystrophy (autosomal dominant CRX mutation with nystagmus); essential tremors; asthma, reactive airway disease, & seasonal allergies; pelvic floor dysfunction, urinary retention, & overactive bladder disorder; ADHD inattentive type; functional dyslexia; Social Anxiety Disorder; OCD; C-PTSD; Persistent Depressive Disorder. Research on accommodation and advocacy strategies, especially that autistic individuals would endorse the need of, rather than just what others think we need. Research on concurrent conditions in autistic minority individuals, (E.G., those with physical disabilities of various kinds, people of color, women, those in poverty).
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Mandate that government services (E.G., SSA, TWC-VRS) accept diagnostic reports of ASD from LPCs, LCSWs, and other masters level clinicians, not just doctoral level, regardless of the level of clinician that made prior misdiagnosis / diagnosis disagreed with by the client). If a clinician is qualified, they're qualified, end of story. There should be access to free or affordable, insured, proximally accessible mental health, physical / medical, and specialist evaluations and prescription services for autistic and other disabled individuals due to such variable and high concurrence of conditions.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The obvious response would be increased isolation and loneliness. Other responses are autistic burnout, autistic skills regression, financial hardship, chronic fatigue, reduced social connections, increased mental health issues.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Positives: The ability to say no to social gatherings. The ability to wear a mask or practice sanitation precautions, and the ability to distance without as much judgment in certain settings. The stimulus check and free Covid tests. Negatives: Disruption in services because people with disabilities (including Autistics) always have to wait ridiculous amounts of time to move forward

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	with basic life needs anyways due to societal barriers. Barriers to ASD diagnosis in adults and adolescents especially because some professionals assume that Covid caused socioemotional developmental delays.
---	---

Name	Charles Coleman, The Arc Massachusetts
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My daughter suffers from Autism, Intellectual Disabilities, gastrointestinal disorders, sleep disturbances, many other medical and behavioral condition as some described in the question. My daughter suffers from transitioning impediments and communication delays. We live in Massachusetts. The ASD and IDD adult services are diminishing and, in some cases, non-existing. Presently the adults in our population are not covered by MassHealth for Applied Behavioral Analysis therapy which is a critical Home Base ABA therapy program. When she matured to the adult system MassHealth doesn't cover ABA therapy for adults. ABA therapy is very effective for individuals, their caregiver and families in understanding behaviors and how best to treat the client, their environment, caregivers and families. DDS has been unable to provide a Day Placement. DDS states lack staffing for no opening of Day placements and some cases closing of day placements. It has been reported that there are at least 6,000 people in need of services. This number will continue to grow as what happen to my daughter when she moved to the adult system in Massachusetts. We have tried to find a private day placement; however, we are having extreme difficulty in the state of Massachusetts Transportation Department providing a van transportation company with a driver and female monitor which our daughter requires to travel for safety and decency issues resulting from potential disrobing incidents.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Massachusetts needs consistencies of services, MassHealth needs to cover adults for Home Base ABA therapy, safe and appropriate transportation for the ASD and IDD community to travel to day placements, doctors' appointments, and other places of importances. We also need a better adult system that directly services the cliental and the adult system must have transparency and accountability to the people that the system serves.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My daughter and others that are in ASD and IDD community in our state of Massachusetts have impediments of acquiring and delivery of services, even when medical necessity requires. For instance, we have been waiting for approximately at least 3 years for DDS Day placement, the state transportation department has been unable to this date been able provide a van, driver and female monitor for transportation to a private temporary transitional day placement; MassHealth doesn't cover adults for Home Base ABA Therapy. DDS and IDD departments in the state is supposed to be dedicated to providing services and supports to the DDS and IDD population. The systems are convoluted and lacks accountability to their cliental. The patent response for lack of services provided no staffing however they provide no direct, plan of action of improvement and accountability. Our community is the most vulnerable.
What additional research is needed to help address co-occurring conditions for autistic people?	Massachusetts Department of Developmental Services (DDS) and Intellectual and Developmental Disabilities (IDD) systems need to be evaluated, analyze, identify the deficiencies and establish a new and improve system to provide needed services to each person that is deem medically necessity to have the appropriate services. There also needs to be a vital component of accountability to the clients which they serve.
What could be improved in autism services and supports to help address co-occurring conditions for autistic	Equitable to and accessibility of services, for instance my daughter has been waiting for a DDS Day placement. for 3 years. We have applied numerous known DDS Day placements. Some of these placements have supposedly

<p>people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>placed her on a waiting list or just stated that they have no opening. To my knowledge there is no criteria in place verifying if there are in fact establish lists, if there are in fact lists, are they being honor and strictly adhere to as placement positions or are people be chosen before other arbitrarily. There is no transparency and accountability in the system. MassHealth doesn't cover adults for Applied Behavior Analysis this needs to be changed immediately this a critical service that is needed. ABA is a cornerstone of success for ASD and IDD clients. etc.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Personal none however I don't know the impact on others.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Definitely disruptions of services, increase in remote work, school, therapies sessions, and some doctors' appointments whether medical or psychological.</p>

Name	Charli Barraza
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Autoimmune diseases are incredibly common among us and pose a very real threat to our well-being, functionality and livelihoods. Connective tissue diseases, Poly-Cystic Ovarian Syndrome, Celiac and other gluten sensitivities are anecdotally too common in our community to be a coincidence, and tend to flare up later in life after decades of unsupported and unaccommodated attempts at living.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Rejection Sensitive Dysphoria is a community-given name for a symptom that is so common among both Autistics and ADHD people, even without co-occurring mental/behavioral diagnoses and it is still so unknown and entirely untreated despite being both a potential threat to our lives, but also a large part of the anxiety that prevents the majority of us from being able to work, even before we hit Autistic burnout or autoimmune diseases in our late twenties and beyond.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Children identified as either female, high IQ, POC or all of the above get overlooked so often it's become a nihilistic joke in our community. We can't even begin to get an idea of what those disabilities look like until this discrepancy is addressed. Everyone needs access to mental Healthcare and diagnostic opportunities, as well as support.
What additional research is needed to help address co-occurring conditions for autistic people?	Autism from our own perspectives, especially those of AFAB, Black, Queer and/or Disabled people. Diagnostic tools that speak a language we (Autistics) understand. Anything that includes our voices as captains, or at least co-captains, of the metaphorical ship. We don't need a cure, we don't need Autism Speaks, we need a voice in what we have a stake in.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to diagnostic opportunities. Increased, more readily available access to all disability support- adaptive technology, mobility aids, closed captions and auto-generated captions, public transportation services, legal support, living support, occupational and disability therapies
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID has exacerbated at least one autoimmune disease, if not brought another one out entirely, for the majority of us who were already living with one. We literally will never be the same after a single infection.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Many of us experience agoraphobia, either chronically or temporarily, and now we have a very real threat to our well-being that reinforces our fears, especially for rural, poor, and/or disabled Autistics who may not be able to receive immunizations for access or medical reasons

Name	Charlie B
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My insomnia makes it very difficult to navigate 9-5 professional life
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Social isolation from not understanding social cues can lead to crippling depression and anxiety for me
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have memory issues from ADHD
What additional research is needed to help address co-occurring conditions for autistic people?	Research on autism in understudied populations ex women, queer people, people with co-occurring disabilities
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Removing the marriage inequality for SSDI
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Chris Bruner, Family
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenge facing autistic children is a comorbidity of symptoms that is always changing. Example: Comorbidity of sleep disorder, find an effective treatment for sleep, patient then has flare ups in mood control, self stimulation, information comprehension, binge eating, or any multitude of other symptoms. The Dr then treats the newly flaring symptom(s) and then the patient goes back to having sleep disturbances.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	1. Finding practitioners 2. Finding practitioners who have experience with autism in combination with other types of disorders. 3. Finding treatments that work, to help both patients and caregivers, in obtaining positive outcomes.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Overall education challenges are the biggest challenge. There is a lack of funding. Funding to help teachers teach autistic children, funding for aides, and smaller classroom sizes. A continued lack of understanding regarding autism and autistic spectrum children. A lack of accommodation for autistic families, especially as children reach middle and high school.
What additional research is needed to help address co-occurring conditions for autistic people?	Research that shows how different teaching styles and classroom environments affect autistic students and their ability to learn successfully.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for all of the services needed would definitely be a big relief. My nephew needed braces for his feet. Insurance only covered 200 of the 1200 service. The braces will need to change as he grows and our family can't afford the services that are needed for his success.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	C19 definitely put a hole in his learning and treatment plan. Lack of access to healthcare therapies and therapeutic services set him back substantially. The switch to electronic education also made it easier for him to be left out and behind.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I believe that it will take a great, maybe insurmountable, effort to help my nephew catch up. Because education is not funded appropriately, and there is not funding for additional treatments, he will be further left behind, and it will be harder for him to succeed

Name	Chris Knobel
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Anxiety and Pathological Demand Avoidance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression and anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	The U.S. is extremely lagging, compared to the United Kingdom, on clinical research of Pathological Demand Avoidance.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More analysis needs to be done on the determinantal aspects of ABA on individuals with Autism with the PDA profile. Traditional autism therapy, behavior modification can cause traumatic experiences for individuals with the profile
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	chris patton
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	badass needs in me fearful, hard to get my body moving, nasty beastly body is shadow of me.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	fearful nasty needs in me, yipping in my meaty mind is bad, bad, bad.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	i typing my heartfilled words, cave in my bad mind, haha, needs full safe life.
What additional research is needed to help address co-occurring conditions for autistic people?	research in milling minds
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	nasty needs in me get worse in covid time. fast heart, anxiety is great
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	vast bad needs in covid nasty for both physical and mental health. i learned to do zoom, safe great needs met in zoom.

Name	Christi Caprara
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues make it difficult to focus and can also push me to avoid situations that lead to overload. Public transportation to a job (that likely has its own sensory challenges) is often too loud, crowded, and smelly. Throw being exhausted from sleep disruption in there and it's a perfect storm for task avoidance and meltdowns or being worn out from coping and masking to the point where it's hard to enjoy personal time.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD and depression make it super difficult to start and/or finish things. There's a lot of stigma and shame associated with needing help. Help also costs time and money. The fear of being judged or having your mental health held against you can trap a person in an unhealthy mindset, environment, relationship, or family situation.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Well it's frustrating to have a difference of ability labeled a disability when it sometimes can be an asset. College programs should take this into consideration. Engineering students shouldn't waste academic time on Chaucer and Sociology majors will really never use algebra. Dyslexics have excellent spacial acuity and visual memory. That's not a disability if teaching takes the proper approach.
What additional research is needed to help address co-occurring conditions for autistic people?	The overlap between autism and adhd as well as how digestive and metabolic differences contribute to both. And more understanding of how these things present differently in people who aren't white and male.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Any state sponsored insurance requires a daunting amount of paperwork that those of us with adhd will often avoid. These are lifetime diagnoses. Regardless of whether we have more or less income and stability we should receive continual medical coverage. Once enrolled it should require no annual stupid human tricks to keep it. Also, meds for adhd, depression, anxiety, etc. should be free. Everybody benefits from those of us who need them taking our meds.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Fewer social obligations- such a relief!

Name	Christie Long
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	-Absences (school/work) - Issues in any of the above exacerbate the Autism (ie., less sleep, higher tendency for communication issues, dysregulation, etc) - Cultural stigmas
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	-absences from school / work - accessible treatment - discernment of when it's mental health vs when it's Autism - communication deficiencies affecting the ability to clearly communicate feeling in an efficacious manner (perhaps related to alexithymia)
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	- seeing relevance in the learning - navigating rigidity of thought in learning - testing iq in students with limited language - need for individualized instruction that is holistically provided, rather than broad statements, following medical model - weakness/deficit model over strength based
What additional research is needed to help address co-occurring conditions for autistic people?	-implications of medical model in schools (as opposed to social model) - chicken or egg? Learning how to address need- Autism or mental health need - assessing iq in nonverbal students? Is there a better way? - complex trauma - late dx in autism - outcomes: are current inclusive models making the cut or hindering growth
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	- education & research into treatment, ie., autism causing the depression/ anxiety or vice versa - continued culture/community work to build tolerance in community to consider and include individuals with autism - you cannot systematize autism; this has to be considered when building systems - screeners
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	All of the above mentioned have been helpful for the autistic community

Name	Christie Patterson
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Chronic fatigue, asthma, loss of functioning of daily duties, muscle pain
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, ADHD, anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication and learning disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	More focus on undiagnosed adults especially women
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Social safety net. It's difficult to get diagnosed as an adult especially without health insurance. We need help accessing basic needs of survival.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Chronic fatigue, loss of skills, depression and anxiety
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Difficulty obtaining income and health insurance

Name	Christina
Demographic	Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Doctors do not look past autism to understand behavior is communication and a person who has limited verbal communication may self injure or exhibit other maladaptive behavior when sick or in pain. They dismiss people who have autism dx. If a neuro-typical person came to an appointment with same symptoms they would run diagnostic tests.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There are many people on the spectrum who have co- occurring OCD, anxiety, SIB to the point of debilitating their quality of life. Please hear and see the population who are most profoundly affected and can not advocate for their self. There is a need for self contained adult programs catering to profound and severe autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenges occur in the most significantly affected population. They are isolated due to their fear of social norms and expectations from unknown people and places. This population needs routine and some type of control over their environment. They can not advocate for their needs and wants in a way that is convenient to others and so they get pushed into settings that can trigger a meltdown that then labels them with behavioral issues.
What additional research is needed to help address co-occurring conditions for autistic people?	There could be a deeper discussion about seizures, PANDAS, PANS, DNA mutations including MTHFR, GI issues, food allergies, paradoxical reactions to medications, high titers from childhood vaccines, HBOT treatment, inflammation and oxidative stress, toxic and autoimmune encephalopathy, sensory processing disorder. People need to be looked at as individuals and do not dismiss their behaviors because they have autism. The growing autism crisis is going to require more health care workers and out of the box ideas. Some ideas to share include drive through clinics for health care. Home visits and sedation for dental care. Community safe homes for respite and health care/ medical intervention that does not require a hospital bed.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I gave a few suggestions, see question #4. Accessibility of services is a huge obstacle for the non verbal population who must rely on their parents/guardians to find providers who have experience and can provide special accommodations. Then compound this with trying to find providers who accept the medicaid waiver. Some information to keep in mind for potential providers is wait time in the lobby, extensive waits in patient room and an office that is not autism friendly. Maybe make one day per week only for special needs patients.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 infection did not cause physical or mental health problems. The COVID-19 restrictions and school closures caused anxiety, fear, confusion, routine disruption, isolation, loneliness, lack of support and staff shortages.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	There is a placement shortage for adults who have autism that need extra support. There is a staffing shortage that is preventing agencies to move forward on new CILAs, day programs, community outings etc. Remote learning did not work for school. We have used telehealth due to debilitating anxiety since lockdown restrictions caused so much confusion and disruption.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Christina Stearns
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	When my son, now 19 years old (Level 3 ASD), was about 15 months old, he began to exhibit severe gastrointestinal symptoms as a sensitivity to dairy. We switched pediatricians several times after being dismissed and advised things like, "He's probably drinking too much juice". We were finally referred to a pediatric GI specialist. While we waited for doctors to take this issue seriously, I researched and tried an elimination diet, which worked (with agreement from the GI specialist afterwards). We were eventually able to reintroduce some dairy foods. I felt very alone in my journey to help my child. In addition, my son has epilepsy, which started when he was 9 years old. He must take medication several times a day to keep seizure activity under control, and there are times that he refuses to take his medication. We have limited ability to explain how important his medication is because his comprehension of language is low. In addition, his expressive language has huge deficits, and he is unable to express words/details about how his body and mind are feeling, so with medical/psychiatric symptoms, we are always guessing how to change/modify his treatment.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My 19-year-old son (Level 3 ASD) has several mental health diagnoses that are layered on top of his autism. His most challenging is schizoaffective disorder, which was diagnosed after his antipsychotic medication (prescribed for aggressive behavior) stopped working. His child psychiatrist struggled to find a medication that would work for him. During this time of constant trial and error, he displayed manic behavior, went multiple days in a row without sleep, and started to exhibit a lack of interest in most of the things he normally talked about. A previous inpatient hospital admission had confirmed that he was having auditory and visual hallucinations. These become worse when his medication is not working. Once we got him on the right medication (over a year after the original one stopped working), his quality of life drastically improved. However, due to his limited expressive language, he was unable to express how his body/mind felt while trialing different medications. These medications are already a huge challenge to prescribe, however, autistic individuals tend to react differently to a wide variety and combination of them. The communication barrier makes this exponentially more difficult. In the last 4 years, he has displayed significant self-injurious behavior in the form of skin picking. He currently has a wound that has required medical attention for the last eight months. Again, the communication barrier makes this much more complex.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My 19-year-old son (Level 3 ASD) has autism (developmental disability), intellectual disabilities, and communication disabilities. I would say without hesitation, that these impact his experience at medical facilities including hospitals, and especially in emergency situations. When he is frightened and confused, he has the potential to become physically aggressive, not specifically with the intention of hurting others, but as a flight or fight response. When hospitals respond by calling security personnel, this diminishes my son's dignity as a person. There are a handful of staff and facilities that have taken the time to understand disabled individuals like my son. When we encounter experiences where he is not understood and handled with patience, it normally escalates to a situation that interprets him to be a threat, when he is the one who is in desperate need of medical treatment.

<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Include the expertise of autism behavior specialists, neurologists, and psychiatrists/ psychologists who have experience working with these dually diagnosed children and adults. Some of the leaders in this industry are at Bradley Hospital in Rhode Island, and the Kennedy Krieger Institute (The Center for Autism Services, Science and Innovation/CASSI) in Maryland.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Patient-Provider interactions including education for medical staff who work with the public, and developmental disability liaisons in hospitals/facilities, who can assist with advocacy for individuals and their families/guardians.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>My 19-year-old son (Level 3 ASD) lives in an Intermediate Care Facility (ICF) in upstate NY. When lockdown of these residences happened in our state, we could not see our son from mid-March through mid-June of 2020. This created a mental health burden for both our child and our family. I understand that this was a state pandemic response, but it went on for so long and did more harm than good.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Positive: Telehealth whenever appropriate is a wonderful thing for this population and those who care for their medical needs. Negative: Health care providers and facilities experiencing long wait lists for services. For several years, my son has not been able to get an appointment with his dental clinic (specializing in treating the developmentally disabled). There are few options in Upstate New York for dental providers who are knowledgeable and willing to work with individuals like my son. Also, staffing levels have plummeted for Direct Support Professionals at residential programs, and these are the people who supply 24-hour care for our residential children/adults.</p>

Name	Christine Buffington
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor because they are not addressed by doctors whereas GI issues, sleep and others are. Also a mainly mental health issues. It is hard to find and retain a good psychiatrist and/or psychologist. It's hard to get medications filled and heaven help you if there is a problem
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self injuring behavior/suicidal tendencies that could and should be avoided if the anxiety and depression were controlled
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Wow- all of the above but if I had to pick just one intellectual because the others can generally improve
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to services. What is offered in Pa is much greater than what is offered in Florida. There are better and more doctors in Pa than Fl. I am certain that this can be said of other states/areas as well.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I still can not get my sons out of the house. This has increased depression but when I try to push they become super anxious and it just goes round and round.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The ability to get out and do things with other people

Name	Christine Conway, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal Mental health
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	All of above
What additional research is needed to help address co-occurring conditions for autistic people?	More training to medical and psychological professionals
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More classes and health related workshops and specifically mental health professionals for this population to treat them appropriately to work thru issues
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increases anxiety, regression and medical issues
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Permanent Reduction of services

Name	Christine Crum, Professionally Diagnoses with ASD Level 1
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have trouble sleeping which affects my mental health, relationships, physical health, and ability to focus and function. My autism makes me hyper sensitive to sounds and textures and small irregularities with either one will wake me up throughout the night.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I've been diagnosed and treated for anxiety, depression, and self harm symptoms. IMO these were caused by the autism and the lack of a formal diagnosis for years. Now that I'm diagnosed, just the anxiety persists. My autism makes me hyper aware of any and all factors and possibilities. I have anxiety if things are not in an ideal order or schedule to eliminate possible difficulties. The anxiety affects my relationships, physical health, and gives me fatigue. The anxiety also takes a toll on my nervous system.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I've been diagnosed with selective mutism. From the ages of 10-20 I was physically unable to verbally speak from time to time. This affected my social life, relationships, self esteem, studies, work, led to self-harm, suicidal tendencies, anxiety, and depression. Being unable to speak was terrifying. As an undiagnosed child it led to a lot of confusion about whether or not there was a place for me in society, whether or not it was worth living, and whether or not I was a truly damaged person with no future. I needed a diagnosis.
What additional research is needed to help address co-occurring conditions for autistic people?	Do more research on autistic females. I know a lot of people are trying.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Programs for autistic adults; Insurance covering THERAPY for autistic adults. I'm barely able to afford my therapy and it's the only service I can find for adults on the spectrum. Services for autistic adults, especially if they have a job and/or a family. Their families will suffer if they don't have support. Education for adults with autism about what's going on in their brain and nervous system and how to tackle day to day challenges. Continuing education about the updated information on female ASD symptoms for medical providers.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None for me. I had Covid twice and it was hard but I wasn't diagnosed then so I don't remember it because I was dealing with so many symptoms alone and blocked it all out.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	It's nice to be able to work from home. I have a college degree and my father gave me a work from home job in his company because I'm very privileged.

Name	Christine Deitcher, Mother of a 9 year old boy DS-ASD
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Allergies to skin and many food intolerances, GI issues, getting them to take their medicines, toilet training (or lack thereof), sleep disturbances like sleep apnea (there's no way my son would sleep with a c-pap mask), we haven't been able to even complete a sleep study in years. Dangerous and Aggressive behavior towards people and property, which I detail in the next answer block.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Dangerous and Aggressive behavior towards people and property. In my experience with my son who also has Down syndrome, this aggression can come out of nowhere and often occurs as part of a perseveration cycle of requesting or demanding something that is not available and bullying me to make it available. When there is no compromise to be had his aggression will escalate to the point where I need to seek safety and then risk him damaging our home. We've been working ABA for years and he's on Abilify and Guanfacine and I'm a mindfulness meditation teacher. I cannot accept this miserable existence we all have to tolerate until death. There has to be something we can do to calm him down. I feel for him. No one likes being a prisoner to their mind. He can't help that these thoughts come up and the strength of the desire to get what he wants, like to go to summer camp on a winter night. His emotional mind just grabs hold of an idea and puts him and the whole family through horrible experiences as it tries to get what it wants. ABA doesn't fix this...mindfulness doesn't fix this. I know because I've been trying them everyday for years.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	All of the above. My son's brain simply does not work in a way that will enable him to function in the world without a 1 to 1 aid, ever.
What additional research is needed to help address co-occurring conditions for autistic people?	Physical research of what's happening in the brain. I would like to look at everything from brain scans to surgical options, CRISPR, pharmacology interventions, gut micro biome studies... I would gladly participate in research studies if we can get my son to comply with the study requirements.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Availability and reliability. We've been receiving services (speech, OT, and PT) since my son was only a few weeks old. He's been receiving behavioral intervention services since he was 2, but they have never been adequate. The providers don't last long because they're always moving up to higher paying jobs and the one who was actually helpful didn't last for a similar reason. I feel like it's a constant cycle of over promising and under delivering. The provider organizations simply don't have what they need to acquire and keep staff. It's not surprising. These kids are some of the toughest kids to work with. My son is in 4th grade and has had the same teacher since kindergarten. She knows him better than anyone besides my immediate family and I can tell you he's still very much a mystery to all of us. She refers to him as her "little tornado."
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My son has had Covid-19 at least once. It is not clear to me that any physical medical conditions he is experiencing are a direct result of infection from Covid-19 at this time.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Lockdown was an absolute nightmare. I had to bear hug my son to attend zooms. It was awful to have to try and force him to be in front of a screen. On the positive, my husband now works from home and that has been such a blessing. I'm not sure if I would still be married or alive today if not for his presence to support me and keep me safe from Caleb's outbursts.</p>
---	--

Name	christine smallin, orange county dmh
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	significant mh concerns including psychosis diagnostic overshadowing
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	differential diagnosis
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	omh and opwdd working together and not in silos; both taking responsibility instead of trying to get the other to take responsibility.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I do not think we know the full effects yet
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	significant reduction in opportunities for community integration, socialization and work

Name	Christopher M Sculley
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I was always different and I never seemed to fit in. So I became very reclusive into my adult life. At 51 years old I still bight my nails and am very fidgety. It's very hard for me to even write this. But if there is anything I can do to help I will do what it takes.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I can never get respect that I think i deserve.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Fitting in with pears.
What additional research is needed to help address co-occurring conditions for autistic people?	Bullying we are a great resource for them to make them feel better about themselves. Some of us don't look like we are disabled.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Into adulthood a lot of us have been denied lots of things that we worked for thing's like education and financial literacy and other services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	For me I stayed mostly isolated as an introvert and recluse it worked out for me.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	CJ Morefield
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Pain, Illness/Injury, and Fatigue - caused by sensory overload, social and professional masking, POTS, Hypermobility Ehlers Danlos Syndrome, Mast Cell Activation Syndrome, insomnia/circadian rhythm disruptions, etc. Many autistic people experience fatigue at significant levels, but also desire fulfilling and meaningful careers. Currently, the system is set up to where if you want to achieve "the American dream," you must also ride the line of burnout while working full-time. Riding that line is extremely difficult and requires foregoing much of what makes life itself meaningful - time with family and friends, traveling, creating, etc. One's life is relegated to strict systems and strategies to merely survive. Autistic people are also more likely to acquire all different kinds of illnesses, some mentioned above, that require significant time off of work for surgeries, illnesses, and flare-ups.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many autistic folks have experienced a great deal of social rejection and exclusion, which is inherently traumatic in a social species. I have never met an autistic person who did not have significant symptoms of trauma. One of the hallmark traits of autism is having sensory systems that are hyper and hypo sensitive, then having trouble integrating all of that extreme sensory information, and responding in the environment in optimal ways -- insert awkward pause here --. Having a nervous system that has experienced reoccurring traumas in addition to challenges in modulating behavior causes or reinforces a lot of depression and anxiety, including suicidal thoughts and behavior. So basically, one of the biggest challenges with co-occurring conditions, in my opinion, is that society (school, work, media) still normalizes one type of brain and pathologizes and "others" different ways of being. What is challenging is working on your depression and anxiety and trauma only to go out into the world and have it reinforced again and again that you're not "good enough." The other is lack of affordable access to treatments that actually help the root nervous system issues that truly disturb quality of life.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	More research into trauma and autism - specifically the effects of social trauma, the rate of experiencing of other types of traumas, and the similarities between PTSD and autism, the short and long term effects of any early intervention trauma (caused by holding therapy/food reinforcements) or interventions that had non-autistic affirming goals (making eye contact, reciprocating, etc) More research into early interventions and treatments for hypermobility/EDS.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable/affordable access to adult autism evaluations! Adult evaluations cost thousands of dollars and are completely inaccessible to most people. Research on "the lost generation" shows that there are many undiagnosed adults who would benefit from access to services and accommodations, most of which are made up of gender, racial, and ethnic minorities as well as people of lower SES. Policies that prevent discrimination based on autism diagnoses, particularly in the military or government work. Equitable/affordable access to nervous system treatments like TMS, Safe and Sound Protocol, etc. Equitable/affordable access to trauma therapy.

	Secondary insurance/medicaid for disabled adults who are working without the requirement that they be on disability first.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Those of us with POTS that I have spoken with have experienced worsening of their POTS symptoms - increases in frequency and intensity of flares. Post-infection, it takes much longer to get back to being able to work than is likely average.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth has been a huge positive that has come from COVID in general. It has increased access for so many people with multiple conditions that make it harder to get to multiple physical appointments. My flexible, hybrid work schedule has been a big improvement for me in terms of sensory overload and my physical health has improved some over time.

Name	Claire
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Ignorant and prejudice institutions e.g. schools, mental health services, doctors, police, social services
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, suicidal ideation, deep shame and fear
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication issues mean we cannot tell others what our needs are so others just do what they want based on prejudice and stigma
What additional research is needed to help address co-occurring conditions for autistic people?	Research into the PDA (pathological demand avoidance/persistent drive for autonomy) occurrence
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Listening to those who have it. Funding diagnosis to reduce waiting lists (UK). ABOLISHING ABA
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	A lot of people are experiencing chronic fatigue without recognition and support. Businesses need to allow work from home option
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased remote work during covid proved helpful for many then it was taken away due to prioritising investments in business workplaces. Severe isolation from lack of informal social access has hurt many people.

Name	Claire Rattey
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Pathological demand avoidance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological demand avoidance
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Pathological demand avoidance
What additional research is needed to help address co-occurring conditions for autistic people?	Pathological demand avoidance
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Any service providers having knowledge of Pathological demand avoidance
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Clayton Oliver
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	This is a broad generalization because autism presents differently in each autistic person, and each autistic person receives a different slate of co-occurring conditions. Speaking solely for myself, the most significant challenges I face from co-occurring health conditions are related to sensory processing issues and sleep disturbances - though the latter may be connected to co-occurring mental health concerns rather than a direct product of my autistic neurology.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, and suicidality are probably a cluster of co-occurrence that should not be assessed in separate silos. If we don't solve the problem of autistic suicide rates, autistic people will keep killing ourselves, rendering solutions to the other problems rather irrelevant. This, in turn, needs to be examined in light of how autistic individuals experience and process trauma differently from neurotypical individuals - and why we marinate in lifelong trauma simply from existing within modern mainstream culture.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I suspect that a lack of research and understanding around communication disabilities is responsible for a great many sources of autistic trauma - and a large number of situations in which the scientific community doesn't actually hear what autistic people are saying.
What additional research is needed to help address co-occurring conditions for autistic people?	It would be nice to see some practical social science focused on improving acceptance and understanding of autistic people in social, educational, and occupational settings.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Until providers are trained to recognize and interface with autistic communication styles, autism services will continue to miss the mark because neurotypical providers will force neurodivergent clients through neurotypical processes.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Again, this is an awfully broad brush. For some of us, particularly those with co-occurring autoimmune disorders, it's still a lethal situation, as it is for all other individuals with autoimmune concerns. For others, a year of social distancing was great because the stress and trauma of dealing with neurotypical society was reduced, and we wish we could keep working remotely and having a valid reason for declining most social invitations.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	See previous - it depends on the autistic person.

Name	Cody Rabalais, Parent/Autism Society of Acadiana Board Member
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The inability for public school systems to provide the care and support for children with co-occurring conditions without outside professional assistance.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Children with co-occurring conditions too often lose out on receiving a proper education due to the lack of ability, knowledge, and training required to ensure these children can be included, understood, and cared for based on their individual diagnosis.
What additional research is needed to help address co-occurring conditions for autistic people?	School districts that allow outside services to come into the schools to help children versus schools districts that do not. Services such as Applied Behavioral Analysis (ABA)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to Behavioral therapies in the school setting to help address behaviors that are affecting the children's ability to receive an education.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	With the tendency of Autistic children to gravitate to electronic devices the requirement for remote learning further embedded screen time into their daily lives. The lack of peer interaction during periods of mental development has forever affected all children especially autistic children who often learn by observing others.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Colette
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I was diagnosed with autism at age 72 and I am now 78 and have just been diagnosed with sleep apnea. I started to use cpap 11 days ago. My memory has been deteriorating since 2002 when I first complained to my doctor about it. A at home sleep study was done and I was told I did not have apnea but I had fragmented sleep. Likely this was an incorrect diagnosis and my memory has continued to deteriorate and it is quite bad presently. It is my hope that using the cpap will cause my memory to improve as it usually does but my apnea has likely been present for 22 years so.....
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I also have amblyopia with sight in left eye limited to motion. I have known of this condition since childhood and have accommodated to it. The minimal sight in the left eye does allow me to know a car is approaching on the left when driving. Fortunately my right eye has strong and near normal distant vision and is now accommodated by bifocals with age. I understand that a greater percentage of those on the spectrum have amblyopia than the general population and the same is true for osteopenia which I have. Neither of these conditions is debilitating presently and I exercise aerobically and do strength training to try to keep the osteopenia from worsening.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I do not have any of the above conditions.
What additional research is needed to help address co-occurring conditions for autistic people?	I am not a researcher so I do not know but I think the medical community should be more knowledgeable about level one autism and also co-occurring conditions for autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need doctors who understand autism and will listen when symptoms are given and not tell the patient that they are wrong about the symptom they are describing. The doctors are not knowledgeable that ND individuals have different symptoms than NT individuals. I have a very high tolerance for pain. I was at the emergency room as I knew something was wrong but I did not have pain. I had an inguinal hernia and 2" of my bowel had to be removed as it was incarcerated. The ER doctor did not physically exam me and finally understood that I had a hernia, etc when he took a CT scan. He told me I should have told him; I think he should have examined me which he did not and he would have found the hernia. In 2002 I told the doctor my memory was affected and he sent me for testing. I said to him but you do not have a baseline as I knew my memory was above average. The neuropsychologist said my memory was within "normal" range, etc but likely the incorrect diagnoses of no sleep apnea and "normal" memory progressed to my current memory difficulties and I lost the enjoyment of my good memory for the past 22 years. Some of my other senses differ from NT patients and again doctors have not believed the symptoms I have given to them.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I do not have a direct answer to your question. I had all of the vaccines and boosters so I never dreamed I had covid on Oct 7 2023. After having a variety of symptoms for some time my daughter suggested I test for covid and yes, I had it. It appears it was present for about 6 weeks and then for about another month my capacity was not what it used to be. I am now just getting back to having my "normal" amount of energy. Since about age 50 I have exercised aerobically and done strength training and my HDL recently

	<p>was 67 which is quite high and likely a result of my enjoyment of gym activities. But, I guess my age of 78 caused the covid too really “sap” me.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I very much like having telehealth and hope the government continues with it indefinitely. I think covid was less mentally detrimental to me because I need less social interaction than a NT. I isolated at home and I live by myself. I had an elliptical machine and I increased my aerobic to 1 hour on it and it strengthen my legs. I also have a full set of dumbbells and love lifting weights. I have a balance pad so I do balance exercises weekly also as well as strengthening and range of motion.</p>

Name	Colleen
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep always running believing people was used as a mule for drugs
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	All of them .. he has been placed in jail Maximum security Elmira 26 guards beat him bad now Wende. The Judicial system, attorneys, judges all failed. Been in and out of system since he was 9 awful
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Authority figures that don't understand autism ... Family court, judges, attorneys, probation, addicted to drugs, was raped it's has been awful ... Was Summitt until he was able to talk.
What additional research is needed to help address co-occurring conditions for autistic people?	Education...school, police, judges, jails, guards, attorneys, it's awful. Due to high functioning Summit learning picked and chose who to keep and sent the high functioning into the world to fail. The whole system has failed badly.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Have services that stop quitting on my son [PII redacted]. Community waiver based program failed miserably, waiting lists that you will never get called. Due to transition to adult they lost my son the courts family Judge [PII redacted] uneducated about any disabilities kept asking why he was acting the way he was and then put him in secured it's been horrible...the services failed summit failed the schools failed all due to Autism and behavior due to him being raped after he was raped is when he was in trouble with the law ... NO one cares NO one so he's in jail Maximum security...I have messages he lost part of his ear was beat so bad. He now has serious issues has mental health seizures so much neglect by jail court it's unreal ... I'm so upset I have 3 kids and 4 grandkids.. pat only child/Adult with Autism !!!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	He went to jail due to waiting list OMRDD services years on waiting list housing etc.... the system has failed my son ... His civil rights have been extremely violated ... City honors refused to educate him saying he was unable to learn.... Due to behavior then police courts etc... failed failed failed ... My son almost died Oct 13, 2022 at the hands of inmates and guards!!! he had broken finger NO EAR LOBE has extreme pain ... Neglect of medical neglect all around ..
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Waiting lists failing services OMRDD services are fully responsible for the neglect and community waiver program never coming due to COVID never calling it was unreal my son still receives NO disability from NYS ... Community waiver program stated due to covid they must not of received it. So [PII redacted] is in jail !!!

in-person social interactions and obligations)

Demographic	Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Access to healthcare - providers and health systems trained in autism to sufficiently support need for services - informed/trained providers, ADA accommodations, sensory friendly environments, reimbursable (private insurance & Medicaid) extended visits for people with autism. Access to quality crisis care - psychiatric, trained behavior analysts, facilities, etc.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Management of aggressive/self injurious behaviors; people with autism are ending up in emergency rooms, restrained and sedated when a behavioral escalation exists versus being directed to trained professionals who can manage behaviors from the earliest point of escalation to situations that become unsafe
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The behavioral health workforce shortage that existed before COVID has become significantly worse.

Name	Colleen Floyd
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My 19 year old daughter with Autism suffers also from Generalized Anxiety Disorder and Schizoaffective Disorder. This comorbidity is complicated by her developmental disability resulting in a low IQ of 67. Fortunately she is verbal and can articulate the horrors (psychosis) she experiences so we can prevent her from harming herself or others but it certainly makes out of home placement (for her safety) very difficult as a youth and soon as an adult. There is an overwhelming need for specialized homes to accommodate people with Autism with severe mental health co-morbidities.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenges occur as the child matures into adulthood as there are limited placements for these individuals who present with a complicated set of needs and abilities. It is not a one size fits all so it must be tackled on a case by case basis. It is hard to plan ahead, not just because of the emotional component faced by parents, but because as these affected individuals mature their needs change. Community housing and knowledgeable caregivers to run that specialized housing is needed at every level of care for this community. It is a heartbreaking societal reality that must be addressed.
What additional research is needed to help address co-occurring conditions for autistic people?	When my daughter with Autism presented with Psychosis in 2019 I had doctors and therapists and psychiatrists and school counselors and caseworkers tell me that they had never seen that co-morbidity before. That tells me that more research needs to be done in this area because as a society we need to be educated to understand, for example, that often "Autism" is not just "Autism" as most people understand it, but instead a complicated set of issues that need to be understood and embraced as part of the diagnosis and therefore part of that person. We need to accept and help one another as these same people still have a lot to offer society.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I made a conscious decision when my daughter was diagnosed with Autism and Schizoaffective disorder to actually say the word Schizophrenia out loud instead of whispering it -which was my initial instinct- because I wanted to in my small way attempt to break the stigma that surrounds mental illness. It was especially hard in my case because my daughter also has a low IQ so she could not articulate what she was experiencing for a couple of years, until we all understood the extent and seriousness of her condition. Once this type of thing is understood and accepted then services can offer more as needed such as specialized group homes that offer intense support. My daughter will be 21 soon so this issue is front and center for me.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	concerned citizen
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I think the most significant challenge to physical health is that we approach healing conditions from a top down, rational to body approach when the problem is in the body. Cardiac health perhaps being chief among the most potent risk factors to autistic health and lifespan continues to receive little funding and remains deeply misunderstood in our population. Additionally there are an increasing number of grant applications seeking to see polyvagal theory research in autistics, but there is little to no guidance on what is considered accurately captured Respiratory Sinus Arrhythmia. Solutions ranging from bleach consumption to behaviorism make these claims with little to no knowledge of how to actually collect or current neurophysiological literature. What may be helpful is research to establish non-autistic baseline data across ages 3-18 for heart rate benchmarks to serve as a measurement for heart rate against.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenges are cardiac in nature, which effects all other systems within the body of a person with ASD. Thus a problem with anxiety and loss of consciousness might be based in period cycles. There is minimal understanding taught to professionals in the mental health space of autistic bodily function and how it influences mental health of autistic individuals. This mirrors the history of mental health which was largely cognitively oriented before it began to focus on the role of the body in trauma treatment. We need to side step this historic mistep, and begin to look for solutions to autistic mental health that take a body, to emotion, to cognition approach. Or stated more succinctly, a bottom-up way of working.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I would argue shortened lifespan. The commonly held view is 17 years shorter than the average american male.
What additional research is needed to help address co-occurring conditions for autistic people?	Research cardiac health and autonomic functioning in autistic individuals for the safe of increasing life expectancy. I'd like to live as long as someone without autism, why can't we do that yet? Cardiac health would be a really decent place to begin.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Mandating that insurance companies treat autism as a mental health condition not a physical health condition. Requiring schools to take an autism diagnosis from a licensed mental health provider, not solely psychologists under reform to IDEA. Medicaid and medicare policy revisions to allow psychological testing to be performed by mental health professionals like LPC's, LMFT's, and LCSW's who undergo adequate training to administer such tests as the ADI-R, or ADOS-2. This would go a super long way in reducing waitlists to diagnosis and still retain the integrity of testing, if not improve it. Differential diagnosis practice guidance and research in this area to prevent more false positives on the ADOS-2 and ADI-R.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic	greater flexibility to remote work possibilities has been realized for the disability community. On the contrasting side, loss of basic social functioning has appeared across nearly all age ranges.

people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Connie Fidler
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Our son has tried to commit suicide many times. He is currently on the correct medication and counseling regime and successfully completed a course of ECT. The challenging part: This is after YEARS of trying to get treatment successfully. Many physicians and/or facilities do not want to deal with the Dual Diagnosis of Autism and Mental Health. It is like a stop sign is held up and you are told to seek treatment elsewhere. The other issue is cost. We are paying out of pocket for counseling and psychiatric care because in order to find a qualified practitioner in both mental health and autism, you need to look as they do not take medical insurance. We have had many practitioners say they understand autism, but after a visit, you realize they do not know how to deal with an individual with autism and you are searching again for someone to assist your family member.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I will answer the learning/communication disabilities portion. We have an IEP and know the methods that assist educating our individuals with autism. The school district and/or classroom employees, frequently, do not understand the importance of following the IEP. For instance, when our son was in 3rd Grade, most of the children with autism missed a question on a fill in the blank/answer with a sentence because of the way the question was worded. The special education teacher did not seem concerned. This happens frequently.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Accessing services is the most difficult part. I am my son's advocate. If he did not have me advocating for him, he would not be able to navigate the healthcare system using insurance and making appointments and finding the correct practitioners for his issues.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	

in-person social interactions and obligations)	
--	--

Name	Coordinated Care Alliance
Demographic	Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Based upon our membership data, over 12% of all individuals with Autism also have a chronic gastrointestinal or genitourinary tract disorder or disease. In addition, approximately 20% of our Autistic population, have a co-occurring respiratory or circulatory disease.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	According to our member data, over 40% of our members have been prescribed an ADHD, Antidepressant or Antipsychotic medication, indicating difficulties maintaining a consistent mental state, potentially creating barriers to employment, education, social interaction and self-care.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Individual with Developmental Disability are who we directly serve. Having severe and profound intellectual disabilities, create significant barriers and restrictions for an individual to be self-sufficient and safe. Often times, IDD can be taken advantage of by "caregivers" or misdiagnoses, mistreated or overmedicated due to communication and cognitive issues. This may be a reason why over 25% of our population with Autism, have not seen an outpatient medical provider in the past 12 months.
What additional research is needed to help address co-occurring conditions for autistic people?	Diagnostic criteria, equal access, Medicaid advancement and increased funding.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	By increasing funding and reducing administrative costs, an enhanced Medicaid system would increase the availability of physician and specialty clinical services such as PT, OT, SLP. Currently, there is a massive discrepancy between Medicare and Medicaid in providers who accept them, same for commercial insurance.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	During the pandemic, resources were limited creating gaps in care plans, leaving people at higher risk of adverse health effects. While those gaps are narrowing, many providers have not fully recovered, creating a myriad of underserved populations, including Autism and developmental disability.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased remote services does hold promise for individuals with Autism as well as other chronic conditions including mental, behavioral and physical disorders. However, improved reimbursement and availability is paramount to long term success.

Name	Courtney, Parent of diagnosed child
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders Sensory integration challenges Motor planning
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son has diagnosed ADHD (combined type) and Generalized Anxiety. His ADHD affects him almost more significantly than his ASD -- especially his impulsivity and aggressive behavior (controlled largely by ADHD medication). His anxiety has him worrying about social relationships, which because he is Autistic, he is not well-equipped to navigate. For example, when he can't get a peer's attention, or he perceives he has been wronged, he will lash out. He perseverates when he perceives he has done something "bad" to a friend (out of impulsivity or inability to navigate the social situation). The rigidity from his Autism exacerbates his ability to navigate friendships. And everything can spiral. I worry about his long term mental health and his risk for depression.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My child has above average intelligence and is highly verbal and communicative. The ADHD and Anxiety mentioned earlier are the larger concerns for me.
What additional research is needed to help address co-occurring conditions for autistic people?	We need more research on the efficacy of clinical interventions to better inform school-based accommodations and professional development for schools. For example, I find that the use of Declarative Language with my child has made mountains and lasting positive impact. Study this approach among other alternatives. Also, occupational therapy-based therapies should definitely be studied more! Public policy should most definitely look at the connection between sensory regulation and academic performance too. The schools seem to be in the dark ages when they look only at whether or not the child can "access the curriculum"
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	See earlier response on school-based interventions. Also, the level of training general pediatricians can't be much. I actually had a pediatrician say to me that she wasn't worried about my son's symptoms because Early Intervention was following him. I changed pediatricians. I can also confidently say that I know more about practical presentations/symptoms of ADHD and Autism than my son's current pediatrician. It's mind boggling.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	I was lucky. My son got diagnosed at 22 months in May 2020 and amazingly got some in-person services during lockdown.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Crickett Ravizee
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenge for autistic individuals with co-occurring conditions is receiving diagnosis and receiving and maintaining care for those conditions. It can often be difficult for autistic individuals to navigate the medical community in order to be diagnosed formally with many co-morbid health conditions. In the case of my own child, because of his communication differences, his complaints were not taken seriously until I had to push for testing after 6 months of active GI symptoms. The GI at UK was more concerned with my son's psychiatric state. My son did end up having a condition called Eosinophilic Esophagitis and a lot of internal damage. He has dealt with diet restrictions, daily medication's, and regular endoscopies since which are necessary, but cause him additional trauma. My son is verbal but as many Autistic people do, he doesn't make consistent eye contact and can be selectively non verbal and unwilling to engage with new people. This has regularly led to difficulty dealing with physicians as many providers feel he should be at an age to speak on his own behalf. My son also struggles with communicating his general health, because he only discusses the symptoms he is immediately experiencing and will not take into account symptoms he is having off and on or the night before which makes it difficult to be screened for regular illnesses. My son also has a sleep disorder and a genetic Allergy trait
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge autistic individuals face with co-occurring mental and behavioral health issues is lack of understanding of their conditions from people in positions of power over them, such as teachers, physicians, employers, police, and even sometimes mental health providers. This is often due to misconceptions about autism or misinterpretations of autistic behaviors. For example, my child's anxiety was often seen as defiance in the school system, because he would freeze followed by a meltdown when continually pushed.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenge autistic individual's face when it comes to other co-occurring conditions, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities is finding people who have the ability to properly assist with these struggles. Autistic individuals with higher IQ are often not given Adequate support for these conditions and autistic individuals, lower IQ are not always encouraged to work with these challenges. Assistive technology would make a big difference in this area, but are often cost prohibitive.
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more research on best practices to educate people who are likely to care for autistic individuals but not necessarily specialize in caring for only autistic individuals. I believe, researching techniques, and then implementing them, would improve the experience of the community as a whole.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Having an autism, sensitive advocate, available and covered by insurance would be life-changing for many individuals.
What lasting impact has COVID-19 infection and illness had on co-	Covid has further isolated many people with autism. The waitlist for care has only grown and many community supports are gone. Smaller programs that were beneficial to autistic individuals mental health often were not able to

<p>occurring physical and/or mental health conditions for autistic people?</p>	<p>stay open during Covid. I have also noticed a decline in my son, overall health since having Covid in 2020 that has impacted his quality of life and his ability to stay mentally healthy.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Disruption in services, and a move to more telehealth services has been a major area of concern with my autistic child. In his case, he does not respond well to telehealth services and disruption of services dis-regulates him. I am grateful for the ability to access telehealth services despite my son, not responding to them as well, however, because it makes it easier to at least access services in times of emergency.</p>

Name	Crow
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbance, sensory and motor challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Suicidality, self injury
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Ids
What additional research is needed to help address co-occurring conditions for autistic people?	Mote research into sleep disturbance would be lovely, especially into circadian rhythm disorders. Lots of autistic people have them and they are commonly misdiagnosed.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Accessible services (text instead of phone call, maybe), less infantilization by medical professionals. Also more financially accessible services, autistic people are significantly more likely to be unemployed
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Services are harder to access due to more precautions with no alternatives for alternate access. Plus long coverage making chronic conditions worse
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Options for remote appointments is good. But only remote can cause problems for people who cant make phone calls or cant speak. Supply chain issues causing problems for people with restrictive needs like specific food, specific medical supplies etc.

Name	Crystal Neihart
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has sensory issues (sounds, new surroundings, etc.) I try to bring him places for example the zoo, or family gatherings, birthday parties, train expos, he loves trains. He gets overwhelmed by all the people, the noises. He has on multiple occasions ran away in fear and put himself in dangerous situations or has panicked so bad that he falls and hurts himself. He has run into the road with traffic not realizing that he could get hurt.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son will get so nervous around new people, and in new situations that he doesnt enjoy himself at all, infact I feel like I am torturing him by bringing him to do what other kids would view as fun.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son has a hard time communicating with people. Often times when he talks to people besides me, they look my way and ask what is he saying. This puts a strain on relationships with family and friends. It's hard to bond with family and friends when you can't communicate. For example, my sons cousins can call eachother, grandma/grandpa on the phone. When my son calls on the phone, he is not understood. Nobody calls him on the phone. Which is stark difference to my other children when they were his age and a stark difference to his cousins. It is sad he doesn't get the same relationships as other children his age.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	My son is attending ABA therapy. The center he goes to is not "in network" with insurance. Clinics that are in network have years long wait lists. Because of this medical will not provide transportation to and from ABA therapy. I have to leave work 2 times a day to transport him myself. I either take sick time, unpaid leave or i balance my hours (for example; start work at 6:30, leave work from 7:30 - 8:30 to drop him off, work from 8:30 - 3:30 leave work from 3:30 - 4:30 to pick him up, work again from 3:30 - 5:30. I work 9 hour shifts so that I can have every other Monday off for speech, OT therapy, ABA therapy, and my bi-weekly meeting with ABA staff and whatever other appointments are needed for myself and family. I am not currently being reimbursed for gas or unpaid leave etc. I was denied Social Security for my son as I make too much money (I am a single mom with 3 children). I requested a MNCHOICE assessment. It took 2 months for someone to call me back to get it scheduled. The assessment was finally done in Oct. I started the process to have him SMRT'd right away. That is still in review. It is now Jan. and since he was not certified disabled in the short 90 day window after the MNCHOICE assessment, I have to start the process over to get services through Dakota County. I am now out of sick time at work.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Crystle
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Managing multiple conditions and trying to figure out which one is causing symptoms. A stomach ache because you have anxiety isn't treated the same as an IBS stomach ache because you ate dairy.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	When they all are acting up at the same time and make life harder.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Providers who don't think you can have multiple diagnoses. Having no resources as an adult. It's very difficult having to work a full time job as it's mentally draining, but I can't not work.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Don't assume we will ask for accommodations when we don't even know what accommodations we can have. Depending on my energy levels, I can not and will not read the reams of paperwork that comes with governmental and healthcare care work. My brain won't absorb the information correctly. Case workers should automatically be assigned when applying for governmental programs and healthcare settings. They should give you the option to opt out if you don't feel you need it or for them to periodically check on you.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Wearing a mask for so long is over stimulating. Certain sensory conditions can make repeated touch feel painful and that makes wearing a mask, even for short periods over whelming. If you have a job that requires mask wearing, that can make over stimulation happen quicker and burnout worse
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I'm happy to have more tele health options. I'm glad to have less stress on social obligations.

Name	Cullen Forster, Veteran
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Hypermobility disorders are common among people with autism, and have wide-ranging ramifications, because ALL connective tissues in the body are affected. Ironically, this may manifest as restricted range of motion, as the muscles tighten under the burden of compensating for loose joints and ligaments, to protect against injury. This hypermobility can also affect the vascular system, up to and including Postural Orthopedic Tachycardia Syndrome, a posture-based increase of the heartrate to compensate for a drop in blood pressure when blood pools in the elastic vessels of the legs – most experience this drop in blood pressure as a faintness upon standing, without loss of consciousness, and as a sudden onset of anxiety due to the biofeedback of the racing heartrate. Hypermobility can also cause sensorimotor challenges for hand-eye coordination and balance, because the loose joints deprive us of useful feedback about the orientation of our limbs – this leads to a general lack of bodily coordination, which may cause accidental injury at a disproportionate rate for autistic people.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Autistic people are trained by society from a young age to behave in a specific way, forcing themselves to hide the way their acute senses present information differently, and to consciously mimic the behavior of others in a bid for social integration. These efforts to mask their differences are frequently unsuccessful, aggravating a social ostracism by those who do not experience these things, and who socialize in a natural way by instinct alone, without conscious effort. A rapidly-growing population of young adults, around the age of thirty, are forced to come to terms with the emotional and physical toll of the excess effort required to socially integrate, and the social mask irrevocably disintegrates under the physical exhaustion. The exhaustion is aggravated by the onset of depression, due to the act of conducting your life counter to your core beliefs, while masking. This subtle development over years of failed attempts at socialization becomes an acute onset of neurological decline and a loss of valued life skills – the common term is “autistic burnout,” but the wording leads outside observers to assume the autistic person is experiencing short-term exhaustion; in reality, this neurological decline takes 3-5 years of applied effort before any degree of recovery occurs.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	A complicating factor is the frequent co-occurrence of ADHD with ASD, which have contradictory traits, resulting in an approximately-normal person with unusual habits – both developmental conditions tend to mask the contradicting traits of the other, until one or the other is detected and addressed. From the dopamine-deficient neural condition of ADHD, and the excessive sensory input of ASD, the individual endures emotional distress when under-stimulated, and physical distress when over-stimulated, requiring a careful balance of stimulus to retain functional behavior. This co-masking nature of the dual conditions leads to a large population of adult individuals who are unaware that their daily struggles to function are not experienced by the majority, and they suffer in silence, ignorant of both disorders they’re experiencing and trying to compensate for.
What additional research is needed to help address co-occurring conditions for autistic people?	Co-screening for ADHD and ASD may help identify individuals who are experiencing and enduring the contradicting traits of both; additional effort needs to be made to consider populations of persons of color and for female patients especially – the stubbornly-prevailing belief about autism is that it only affects young, white, male children, when that is simply the population least-strongly conditioned by society to hide their autistic traits from scrutiny.

	<p>Autism and ADHD are far, FAR more prevalent than current figures depict, especially when considered as a co-occurring condition; the CDC lists a figure of 1 in 36 individuals, while the apparent prevalence – in the university setting – is much closer to 1 in 10, by visible behavior signs alone. Add to that figure the number of individuals who have become adept at adapting their behavior – by conscious effort – to societal expectations, and the figure rises sharply; they are still autistic, and still suffering difficulties not shared by the majority. Updating current institutional knowledge about ADHD and ASD, to reflect the actual lived experiences of autistic people, is critical to helping autistic individuals find community and support from their co-sufferers, who have learned effective coping skills for the struggles involved with their unique neurological development.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>The capacity of screening and diagnosis for adult autism desperately needs to be expanded, nationwide. The waiting lists to receive a screening or diagnosis is months at minimum, years at the worst, which can have negative results as the person awaits receipt of official documentation, to receive accommodation in the workplace or scholarly setting. The cost of the screening is also excessive, at approximately \$3000 out-of-pocket, especially considering the possibility of receiving a false-negative diagnosis from a provider with outdated, male-centered education about autism.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Under the acute sensory environment of autism, the altered senses invoked by “long COVID” may be especially disabling for autistic people; previously-acceptable foods may no longer be edible with an altered sense of taste, further limiting their access to adequate nutrition. Under long COVID, the reduced lung capacity may compound with the effects of POTS to induce struggles to remain conscious after standing, at lower thresholds than previously endurable. The disproportionate injury rates for autistic individuals with hypermobile joints – and the problems with hand-eye coordination that accompany it – may be negatively affected in the rate of healing, with a hindered cardiovascular capacity under long COVID.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The increased access to and acceptance of remote work is almost certainly of most benefit to autistic persons, allowing them to better function in a sensory environment tailored to their needs. A cultural drive to “return to the office” may deprive opportunities for employment for individuals who were previously able to provide labor – an internet connection is much more accessible than a functioning car and a suitable commute. Additionally, forcing autistic people back into the workplace, when remote work was previously feasible, subjects them to sensory environments they can’t control, negatively affecting their capacity to work, and hurting the output of the workforce in aggregate. Hostile social work environments are especially detrimental to autistic people, who struggle with performing the correct body language, and who are not naturally adept at operating within the confines of social hierarchy; these are learned skills that take time and patience to cultivate, and inadequate management structures lead to failures to mediate social conflict – the figure of only 15% of autistic people maintaining steady employment is directly reflective of a near-absence of effective support within the workplace in Western society; autistic people bear nearly the entire brunt of trying to maintain safe, productive workplace relationships, or face chronic unemployment.</p>

Name	Cyndi
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is extremely high in some, especially when someone is non-verbal or minimally speaking. More focus on how to help this vulnerable population is important.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Autism at its core, is a social communication disorder and a developmental disorder. This questionnaire is very misleading, since these are not “comorbidities”. All of these issues cause significant negative impacts on many with ASD. We need to bring even more focus on the people with ID and severe communication challenges. They are being left behind and spoken for by verbally-privileged advocates. Their experiences are very different. More families need to be listened to so our loved ones will stop being put in the dark.
What additional research is needed to help address co-occurring conditions for autistic people?	More research on gestalt language processing, AAC, different therapies for autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More everything. Children and families are suffering. They have waiting lists up to 2-3 years in some places for diagnosis, as well as several months for therapy. High needs adults are suffering. Lack of day programs, group homes, therapies are a very huge burden on families.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My adult son developed Autistic Catatonia during the pandemic and is still recovering. All of the day programs in our area are still functioning at minimal capacity due to losing so much staff during the shutdowns. Most clients haven’t been able to return. I have been told there has been a spike in catatonia diagnoses in our area due to the loss of services. My son was severely injured in a day program that reopened at minimal capacity after the pandemic. He has been home with me ever since. Safe options are minimal, and that is inhumane. The high needs community are not properly being represented by your verbally -privileged self-advocates and that needs to be fixed NOW.

Name	Cynthia L. Reed, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy, Celiac and Diabetes mean that we need to constantly monitor all food/drink intake and be sure that meds are taken regularly. Any GI or A1C disruption means poor sleep which triggers seizures. Constant observation for seizure activity. Our son's life is monitored every hour he is awake and we sleep with an ear to any unusual sounds/activity. We need to remind day staff about his dietary restrictions. Group home providers in our state will not accommodate his diet restrictions so he remains at home as we age.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	He is self-injurious when he does not feel well. It is one sign that we need to check his health status more closely. Usually gut related and sleep deficits lead to these behaviors. Close observation and management to prevent these issues requires full time caring and he is now 31 yrs.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Our son is non-verbal, so relies on speech output from his augmentative device. He has no ability to describe pain, feeling poorly or respond to medical questions. He has developmental and intellectual disabilities. Family members accompany him everywhere when not attending his day program. He does not drive, cannot work independently, and has no safety awareness, so parking lots, exiting a building, danger from strangers are ever present.
What additional research is needed to help address co-occurring conditions for autistic people?	Research that explores the connection between gut health and developmental delays. New approaches to speech and language acquisition. Look into why cancer rates in people with Autism is so low and what else may be connected to that "protection" as a way to unscramble some of the associated comorbidities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easier access to regular meds so that prescription renewals are not an anxiety producing event as insurance companies have tightened the window for refills. Medical and behavioral teams that do home visits for routine medical procedures and behavioral interventions/trainings. Housing for adults with Autism!!! Provider training for more effective care. Recognize that "community" is the place that welcomes our son, his posse, NOT forcing him to be part of the broader community. Have program providers understand medical comorbidities and train staff to make appropriate accommodations.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It was a re-set. More online programs were offered which was a huge bonus. Forcing autistic people to attend in person classes, recreation etc, is not always in their best interest. Online classes (yoga, dance, strength & conditioning) are accessible and cost effective. Every state should offer them statewide. The resultant online community is amazing. Train more providers of these services. Huge fall off in community work opportunities, volunteer and paid. Need to regain and expand those opportunities.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	Telehealth and online programs have been wonderful and should be expanded. In person opportunities are growing, but can be over-rated. Social interactions should be meaningful rather than just more time in a van going from A to B. "Social" needs to be re-examined to include what is meaningful for autistic individuals, not what the general population considers social. Overcoming sensory issues in many public settings makes it not worth participating as the rest of the day becomes a nightmare.

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Cynthia Macluskie, Autism Society of Greater Phoenix
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders, feeding issues due to sensory issues resulting in limited diet and interfering with social relationships, ADHD, Obsessive Compulsive disorder, epilepsy, mitochondria issues and genetic abnormalities, sleep issues, sensory issues, epilepsy that presents as violence, motor planning issues, articulation and social pragmatic issues,
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	1. Aggression and self injurious behavior often as a result of pain or seizures and inability to communicate the pain. 2. Anxiety and it inferring with building social relationships and participating in social activities. 3. ADHD 4. Executive functioning and planning skills 5. Depression.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I think the medical co occurring issues are the most important as they impact the ability to participate in life and live pain free. Often they are mislabeled or misdiagnosed and many professionals do not validate or listen to the family or the individual. Learning disabilities such as dyslexia can impact how they learn and their success. Often the global diagnosis makes getting additional services for learning disabilities difficult. Communication disabilities can be profound. Many believe that people who are non verbal are also not very bright and do not have thoughts or feelings. This is not true.
What additional research is needed to help address co-occurring conditions for autistic people?	the biggest issue is raising awareness with the mental health and physical health professionals that work with those on the spectrum. There is so much discrimination and lack of knowledge around comorbid conditions. We need to use research to inform and educate professionals.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Education of professionals at ERs, behavioral health facilities and medical professionals. Allow for complete medical evaluations in behavioral health facilities instead of saying these evaluations are outpatient services. Allow ERS to do complete medical comorbid evaluations for those with complex symptoms whose behaviors may prevent them from getting outpatient evaluations. Fix billing issues that would allow for both behavioral and physical health evaluations at the same time.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Cynthia Tyler
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As the mother of an autistic child, I have witnessed the co-occurring physical health conditions from nearly the birth of my child. Sensory and motor challenges, including potty training, food aversion, educational structure challenges, and lack of societal support and understanding abound. As my child has grown and aged, it has changed to include gaining a tremendous amount of weight, which has contributed to sleep apnea. Food aversion means that there are only a limited amount of foods my child will eat, and those have become more expensive. The types of food also can't be swapped out for cheaper brands, due to the additives like bleached wheat flour and high fructose corn syrup which contribute to heartburn and reflux. Sensory issues also cause skin-picking, which can become infected. We have to carefully monitor hygiene, in order to prevent any further hygiene related issues. Dental problems have occurred, as tooth brushing is its own type of sensory issue, which have only resolved through therapy work and supports. It also extends to psychological health, as media has to be carefully curated to prevent exposure to concepts that my child does not have the current capacity to process, understand and interpret. These will only continue as my child ages into adulthood. This will impact my life as I age and will have to care for him until I die.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am fortunate that my child is relatively mentally healthy. He has been surrounded by a positive and supportive environment, which has contributed to that. However, that is an outlier in the statistics. An autistic child will thrive in an environment that supports them, and many many autistic children do not have that, which results in poor behaviors that they model, or react to, as they have no other source to draw from. Regardless of how positive my child's family support is, my child still will experience over-stimulation from stress, environmental changes, sickness, hunger. The reactions to these include jumping, hand flapping, audio-visual stimming, and occasionally a rare meltdown.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My child will not have a robust social life, nor an independent one where he can live fully on his own. It is difficult to connect with other peers, and it will not be possible for him to live independently. With supports, he will hopefully be able to have a happy and full life, but without supports he will wither. There is no way an autistic child will be able to thrive without supports.
What additional research is needed to help address co-occurring conditions for autistic people?	All of it. More funding is needed. A more comprehensive understanding from society that autism has profoundly changed the fabric of how we live our lives together. More research in how autistic individuals can be critically important in understanding the use of higher-level algorithmic thinking that is now employed in most of the technological applications we use daily. And you must include autistic individuals in a collaborative way while completing research. Autistic people are not diseased and unaware lab rats. Listen to autistic voices FIRST.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autism is as common now almost as common as wearing glasses- which is the most common disability in the world. It should be as easily adapted to as that. Disability services in this country are abysmal and need a massive update. Ask autistic persons FIRST and LISTEN to what they say they need, involve them in designing the access to services and supports.

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>In a way, it was a quieter world during COVID. Autistic people were more isolated, but some (not all, as not all autistic persons are the same) were more able to regulate their environment due to the isolation. But autistic persons with higher-support level needs also experienced a struggle as their caregivers experienced that isolation as well, which did become overwhelming in cases. Remote access jobs are a boon to the disability community as a whole, the technology removed the mobility requirements and access requirements, and as we have shifted back from that in the following years, that has negatively impacted disabled Americans, not just autistic persons.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Remote work actually benefited many disabled individuals and autistic persons. The remote work allowed them to interface and interact in more accessible ways. The disruption of schedules was disastrous, however, as structure and schedules are the backbone of many autism families.</p>

Name	D. Buzz, guardian and SDE Supervisor
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Lack of quality and qualified services. Critical lack of individuals properly educated and trained to care for autistic individuals with co-occurring physical and behavioral needs. There is a critical need to develop college-level curriculum that focuses on caring for these individuals.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of access to what I call focused services both medical, educational, vocational, social and community. The generic education and training that so called professionals have is inadequate. There have to be doctors, teachers, social service staff and, most importantly, personal care companions that have very specific training and skills in this area. More money needs to be directed to paying these individuals an appropriate and livable wage and FAR LESS on administrative positions. In other words, too many dead wood at the top and not nearly enough hands-on workers where they are desperately needed.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Too many administrators and not nearly enough thoroughly educated and properly trained care givers
What additional research is needed to help address co-occurring conditions for autistic people?	No more research is needed. Let's apply what everyone knows about this situation to creating more jobs and wages to the people desperately needed to do the hands-on, every day care.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above. And those supports and services need to be implemented immediately. The time for talk and discussion has long passed. These individuals need ACTION!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Another excuse to funnel money away from where it is needed and another excuse to undermine the work force needed.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Simply put, STOP USING COVID-19 AS AN EXCUSE TO NOT DO YOUR JOB.

Name	Dale
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Constipation creates enormous discomfort and makes life and learning miserable and difficult. Limited motor skills, apraxia, dyspraxia, means inability to complete everyday self-care and basic tasks required to live independently. It also leads to inability to communicate verbally and makes communication using AAC difficult.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is clearly a massive problem for many with autism. Life with severe anxiety is extremely overwhelming at times. Self-injurious behavior is quite common, even for those who are considered higher functioning in the autism world. In my experience, it increases along with physical problems such as constipation, or any pain, and of course, inability to communicate which is immeasurably frustrating.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	communication is most important. Even those with intellectual or developmental or learning disabilities can communicate verbally. But if you have motor issues, it is much more difficult to communicate verbally or using AAC.
What additional research is needed to help address co-occurring conditions for autistic people?	Study people with autism who have learned to communicate by using a letterboard or keyboard (S2C or RPM). There are a number of people with autism who can type independently. They should be approached and the issue of how to research and study this form of communication should be discussed.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above are needed. People need to be trained to provide the medical care as well as learn to support people to communicate using various types of AAC
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Many programs for adults with autism have disappeared since Covid. Transportation services have ended in some areas.

Name	Dallen Williams
Demographic	Autistic individual; Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most common conditions I see in myself and other autistic people, as well as those in the community are ADHD, sleep, sensory and gastrointestinal disorders.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	With each co-occurring condition, the autistic person becomes less independent. This can lead to a host of mental health disorders in addition to the autism diagnosis. Co-occurring mental health disorders also make autism and the co-occurring disorders harder to diagnose. This often leaves the person with the co-occurring conditions under- or over-treated. These individuals may struggle with greater instances of self-medication in the form of drug or alcohol abuse. They tend to engage in riskier behaviors and have a smaller support network, especially if they are late diagnosed. The individuals typically suffer low self-esteem and have difficulty maintaining gainful employment. Personally, I have co-occurring ADHD, depression and anxiety. I was late diagnosed with ADHD (28) and Autism (35). Treatment of ADHD was only partly successful because the autism went undiagnosed. While I have maintained employment my entire adult life, it has been well below what I should be earning. I find that I burn out at about 6 months regardless of the work and struggle with attendance. These are things I have witnessed in other people with similar co-occurring mental health conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant issues I've seen caused by other co-occurring conditions tend to be attendance issues, disciplinary actions taken against individuals because they struggle to communicate in a way that is easy for neurotypical people to understand which can cause anything from minor squabbles to actual fights. Gainful employment is hard to obtain and maintain because of the interview structure and the lack of accommodations in roles that are better compensated for people with communication difficulties.
What additional research is needed to help address co-occurring conditions for autistic people?	Adult and female autism should be researched extensively. Current autism models are based primarily on studies of male children, same as ADHD. With the general lack of study of female autism and ADHD, women are often left to self-manage and many are never diagnosed in part due to the different social expectations on females. This leads to lifelong self-esteem issues and often abuse. The separate disorders and the way they interplay to become somewhat invisible in women should be a major focus of study.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	One thing I've found particularly helpful is software to "read" text to me. One on one training on the job is also helpful. More community resources that focus on adult life instruction. Many of us grew up with parents who also did not possess the skills to lead a successful adult life as many of us inherited the conditions. Things like balancing a check book, paying bills, filing taxes, and generally organizing life in some way, down to cooking and cleaning do not come naturally and were not taught to us.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	As an Autistic ADHDer with anxiety, depression and a host of other conditions, I found that the lasting impact is anxiety so severe surrounding doctors' offices and anything that involves going into an office where a sick person might have been causes not only anxiety attacks but also meltdowns. I have not seen a medical professional in person or had blood work done since late 2019. This is particularly dangerous since I have multiple medical

	<p>conditions that require better monitoring, but doctors' offices have not been accommodating of the mental health reasons, I have not been able to go in person. Odd hours or booking so that I can go straight into a room even if the visit takes just as long.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The most positive effect COVID19 had for autistic people is the restructuring of society to allow autistic people to be in public with things like masks, headphones, sunglasses and hoods up on hoodies. All of these help with sensory issues. There are also more work from home jobs which allow an autistic person to create their own work environment. The negatives include having these accessibilities removed, particularly work from home jobs as many employers feel the need to micromanage. This adds back multiple layers of stress and may result in the person leaving employment or losing employment due to meltdowns. Examples of this include significantly increased social interaction which typically requires masking, increased uncontrollable sounds, fluorescent lighting, close proximity to others, and the commute.</p>

Name	Damaris Hadayia , Parent
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Insurance coverage for the conditions and the availability of therapies on public insurances. The availability of resources for families, to make all the pieces fit together (work and home life) while still providing the needed care for person.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of money and resources to properly manage the comorbid conditions within the families. More conditions cause more absences from work which places families at risk for homelessness and hunger.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Finding the suitable treatment to help with the host of the challenges listed above. Constantly trying to improve education and treatment through the school systems as they constantly try to cut services.
What additional research is needed to help address co-occurring conditions for autistic people?	The benefits of therapies like ABA, benefits of comprehensive IEPs families don't have to fight for, and the affects that more resources would have on the improvement of comorbid conditions and overall wellbeing/ life satisfaction for people who have them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to education and services based on the person, not on school systems/ insurance companies estimation of the cost and the "percieved benefit" of someone they don't know. Better access to programs that help with the cost of having an autistic loved one. Better programs for parents who work and support an autistic loved one. Better transparency in the SSA system and claims through them for assistance! Getting your child the right care/ education and resources should not be an uphill climb made more difficult by those who are supposed to be helping.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It gave my child asthma, which he didn't have before. It also halted all of his therapies, caused me to loose my job, then my apartment trying to care for him during covid as schools and therapies were basically nonexistent. It destroyed my family's life, and eventually cause our homelessness! This should never happen to a family, because of autism!
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Negative- disruptions in services, years of waitlists for therapies and treatment that didn't exist before. Employers attitudes towards parents with children who are disabled has changed for the worse. Theres no longer an ability to balance work and care for severely disabled children. Less resources!

Name	Dana Haff
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Autism is frequently associated with hypermobile Ehlers-Danlos Syndrome (a genetic link is being studied). I have been diagnosed with autism, hypermobile Ehlers-Danlos Syndrome, hyperadrenergic postural orthostatic tachycardia syndrome, mast cell activation syndrome, myalgic encephalomyelitis/chronic fatigue syndrome, nonepileptic seizures, metabolic syndrome, a multinodular goiter with carcinoma that required a complete thyroidectomy, degenerative disc disease, an annular tear of a disc, adenomyosis, an adrenal adenoma, and more. I have yet to see a provider who has any understanding of autism and frequently associated comorbid conditions.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression-like disorders and anxiety-like disorders are rampant in autistic people. However, many of us get minimal relief from standard antidepressants or anti-anxiety medications, raising the question of whether it's really depression or anxiety as currently understood, or whether there's a different cause for these symptoms.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Sensory integration and processing are huge issues and are ignored in adults. It's like the assumption has been made that autism magically vanishes at age 18. It's appalling that services for adults are almost nonexistent.
What additional research is needed to help address co-occurring conditions for autistic people?	Genetic research to provide a better understanding of the common comorbid health conditions, especially as a consequence of hypermobile Ehlers-Danlos Syndrome. I have had several relatives die of strokes due to vascular disorders. I don't want to be next.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Teach providers about comorbid conditions. No physician I have seen has even a rudimentary understanding of the health conditions that frequently co-occur with autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Many of us have developed post-viral sequelae because hypermobile Ehlers-Danlos Syndrome is a common pathway to a virus causing ME/CFS, Long COVID, and other post-viral illnesses. I can't say this often enough: no doctor I have seen has any understanding of this.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I had Medicaid for a while and was granted 40 hours a week of caregiver services. The public health emergency ended, I was removed from Medicaid, and now I have no services. I've basically been left to die.

Name	Dana Holz, Center for Drug and Health Studies, University of Delaware
Demographic	Autistic individual; Family member of an autistic individual; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have concerns about mental health conditions and people with autism. There are problems integrating developmental disability systems and mental health systems. I worry about suicide in the autism community, lack of good crisis response systems for this population, and long ER stays while autistic people wait for mental health treatment. I also think more attention should be paid to substance use prevention and sexual health promotion for autistic people.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Systems do not talk to each other. Mental health needs are too often defined as behavioral challenges.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	There is a lot of attention on so called "high-functioning" autistic people, as well as people with very severe needs. All three of my sons are autistic. Two are minimally verbal and are in autism classrooms. They kind of fit in the middle of both of these populations, and I feel like the people in the middle are kind of left out of the conversation.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on substance use, sexuality, victimization, crisis response, mental health.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Reduce silos in governmental agencies so that funding can be directed to this population, and so that programs are inclusive to autistic people and other people with disabilities. For example, SAMSHA could require states to report disability status in mental health and substance use treatment data and/or provide funding for programs that would be more disability inclusive.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Dani
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges and gastrointestinal problems
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression for me
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication difficulties
What additional research is needed to help address co-occurring conditions for autistic people?	Firstly, more available assessments for adults
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage and access to services
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Danica Allen, Educator
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Limited ability to accomplish the things I want to accomplish.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Difficulty being taken seriously, autism being dismissed as symptoms of cooccurring mental health issues. Doctors trying to medicate my neurotype.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Limited access to resources, community involvement, education.
What additional research is needed to help address co-occurring conditions for autistic people?	More research into real lived experiences.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I like the example given. Also—more individualized support for each unique individual. More funding.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Daniele Armstrong
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	All of co-occurring physical health that are specific to each individual affect them differently and to varying degrees. Focusing on a few specific conditions does a great disservice to autistics who have other conditions that they need more medical, emotional, physical and tangible support needs.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Sadly these questions want to separate different types of conditions, physical, mental and emotional, etc. into groups that will disservice great numbers of autistics. Just because one autistic isn't affected as much by one condition as another autistic will be, does not devalue other mental health conditions that need just as much if not more support a few selected conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Like many people, needing to compartmentalize to break things out and make it easier. I understand why these questions are so specific. Although, since we are looking for ways to service autistic community this is another question to devalue a great number of autistics with the co-occurring conditions.
What additional research is needed to help address co-occurring conditions for autistic people?	Looking at individual conditions with every autistic is the best way to assess and filling those needs. Not a lump sum survey, that will serve very few. Any services will be greatly valued, but still nonetheless, leaving many autistics, isolated and excommunicated even more in our society.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Sadly we need to address the bias within most people who are allistic or those were those who have been mold to believe there is no such thing as autism(even if they are unknowingly Neurodiverse themselves) they are just spoiled and demanding attention, and just need to conform to social ideals. Second, would be addressing the compounded complications of functioning in our society when autistic. For those who have high needs, disabilities that are diagnosed or undiagnosed, along with co-occurring conditions, make it nearly impossible to confirm and work to provide for ourselves in our already failing economy. We have those who are extremely fortunate, looking down at all people with less resources, just telling them to work harder, save more when they are unable economically with the funds, they have to take care of themselves in any capacity with a system stacked against them. This is strong and probably a word solid to most but there's only so much you can express in little boxes.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Danielle Christy, Private Practice psychologist
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances, seizures due to epilepsy
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Co-occurring mental health issues including anxiety, depression, ADHD, and other mental health diagnoses. These can cause debilitating symptoms for people with all degrees of verbal fluency and cognitive ability. There are not enough mental health providers with evidence-based training in both the medical and educational systems.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of training and evidence-based practices by schools to support language (AAC devices), behavior, and learning.
What additional research is needed to help address co-occurring conditions for autistic people?	Research that is led by and organized by autistic individuals. Less research about etiology and cause. More research about how to support this wonderful group of people in the way they believe is most effective.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More training for all medical providers and educational service delivery systems. Move away from deficit driven medial model to a social model of disability where we look more at environmental modifications instead of changing the person. Less funding of ABA and more funding of interventions consistent with the social model of disability.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	For many with co-occurring anxiety and depression, the isolation has continued and caused significant impairment in daily life activities.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Some people and children found remote or virtual work/learning less anxiety-provoking and were able to switch to jobs or schools where this was more of an option. That is a positive. Some people and children had increased anxiety during COVID and due to the isolation did not leave the house, which reduced their social interactions and actually heightened their anxiety so they are still living in an isolated state.

Name	Danielle Mays
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Being developmentally behind; not learning or grasping things the same way others do; unable to communicate verbally; intellectually stunted in areas.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, more accessible information, programs for all age ranges, services and therapies more widely available, education for both neurodivergent and neurotypical people on autism and other conditions
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Danielle Terrell
Demographic	Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Challenges caused by co-occurring physical health conditions can significantly affect all activities of daily living. The need for families to change their environment to adapt to the needs of this autistic children and family members. Co-occurring conditions can lead to significant challenges accessing appropriate healthcare, & financial barriers.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Access to mental health care resources and services. Limited mental health providers who have experience working with autistic people. Limited professionals trained to work with challenging behaviors. Injury liability. Not enough staff to support individuals with significant needs.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of resources throughout the lifespan.
What additional research is needed to help address co-occurring conditions for autistic people?	Research for autistic adults continues to lack. Addressing gaps in research and increasing studies for non-white cisgendered males. Research on co-occurring mental health conditions. Supporting autistic adults throughout their lifespan. Future planning. Research around co-occurring PANDAS and PANS as diagnosed children become autistic adults. Healthcare access and training of healthcare professionals to support autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Address staffing issues that have existed for decades. Equitable access to healthcare services, and therapeutic services. Increased training and support for parents and caregivers.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 has impacted individuals, hypersensitivity to infection, increased behaviors, increased anxiety, changes in routines, identify crisis, limited access to services, increased barriers to service.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruptions in services, switch to virtual modalities/tele-health, changes in routines, regression, agoraphobic thoughts and/or behaviors. I have a client who was diagnosed with PANDAS as a child, and developed OCD. Their OCD was described as moderate, and they was able to manage his OCD and live a routine life, attend school, social events etc. Since getting the COVID vaccine, and tested positive for COVID there was been a significant spike in their behaviors and OCD tendencies, increase in agoraphobia, and limited social interactions due to heightened anxiety, multiple hospitalizations, denied access to services, financial burdens on the family. Health and safety risks for the autistic person and their family.

Name	Danielle Willsher-Goodman
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Ehlers Danlos connective tissue disorders, joint laxity and instability, problems with dislocation, subluxions, poor skin healing, bruising easily. Fibromyalgia, pain in muscles and chronic fatigue. Issues with POTS balance / dizziness, palpitations varies with degrees of nutritional deficiencies at time as to how bad suffer. Gut biome issues and gastro issues like IBS, constipation, problems with internal organ and soft tissue issues, GERD Sphincter not closing, gas, bloating, chronic coughs, sore throat. Often issues with allergies. Issues with gut also play into being able to digest/swallow food . Also gynecological problems extremes periods menorrhagia bladder problems . Back / neck and muscular skeletal problems in general after poor posture strength in muscles and soft tissue impacted by stress and strain and also inability to gain right nutrition. Also, stress and strain impacts peoples ability to utilize and digest the necessary protein and aspects of lactic acid for collagen production from Lysine. Also issues with dyslexia and dyspraxia can cause terrible self worth and issues feeling like failure or not able to do things and problems with parents, peers and teachers when not seeing or understanding hidden disabilities and thinking lazy and getting punished. Also sleep disturbances, issues with ADHD and concentration too. Sensitivity to foods and ingredients and also medicines.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Mental health, coordination, challenges in school, bullying, concentration, masking from dyspraxia to fit in end in disasters in relationships mistakes, challenging peer relationships, dangerous behaviour, self hatred, blame, scapegoating, suicide and self harm in later stages after years of misunderstandings, blame, ill treatment, bullying and not being listened to
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Misunderstanding, poor diagnosis in time, being bullied in interim, lack of support, lack of group support, too much pressure, not being understood by schools, parents, support services, mental health people, all leading to breakdown and blame, internalizing suffering.
What additional research is needed to help address co-occurring conditions for autistic people?	Listen to peoples experiences, read, lots of helpful diagrams online, many people disbelieved all life. Need to be heard and believed. Text book conditions do not always catch people who are on periphery but they suffer all the same and should be listened to even if do not tick all boxes and criteria. Sliding scale and spctrum with veying degrees depending of diet, coping mechanisms, gut health, life experiences, support. Many struggle to speak their experiences and need support helping to express what they are going through. Very distressing when had lifetime of other stressful and strenuous experiences
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Client centred support built and designed around them and their needs as all individual with individual interests, experiences, preferences and had lots of bad experiences with services already. Need more gentle, tactile, compassionate, trusting and reliable access with colour, safety nets with sensory considerations factored in and no hard and fast expectations.
What lasting impact has COVID-19 infection and illness had on co-	Lock down increased stress and anxiety and brought new level of threats to those suffering with compromised immune systems

<p>occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Less trust, less freedom, more judgement from society and newspapers which is very unfair and increased anxieties and stresses with schools, parents, exams, work, people not understanding fears over germs/virus and issues it has on disabled community</p>

Name	Danni Zou
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disruptions, sensory processing Would also love to see research into any connections with hypotonia and hyperflexibility
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA!
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	More research into PDA, including emphasis on how to best serve in the school system
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Supports to improve education for very high cognitive autistic individuals
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	remote appointments with providers that do not capture the individual

Name	Danny Schaible
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Hyperactive catatonia that co-occurs in ASD, particularly with individuals with profound autism. We need better identification, treatment, access to treatment including ECT, and better catatonia scales for neurodevelopmental individuals.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggressive and self-injurious behaviors, in many instances it is believed, associated with catatonia.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Much much better recognition of and early intervention of autistic individuals with catatonia. Any individual that engages in chronic aggressive or self injurious behaviors should be screened and potentially treated for catatonia, but this often does not happen or happens way later than it should. How can we develop better protocols for screening and intervening in this treatable condition?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Danyale Sturdivant
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders because they are often overlooked and can cause issues such as sleep disturbances as well as behavioral issues. Additionally, ADHD is another co-occurring disorder that is often missed
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD and Anxiety is often misdiagnosed in black children and other children of color and can be mistaken for other disorders such as ODD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Culturally responsive research needs to be included to address the intersection of RACE, GENDER AND AUTISM
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Culturally Responsive Research, Diagnosis and Treatment
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The increase in a lack of skilled service providers who are able to provide telehealth services
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruption in services

Name	Darcy Janowski , parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	We had to start my son on antipsychotics at age 3 because he was walking my countertops and would not sleep. No safety awareness,elopement
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	aggression when frustrated or doesn't get what they want. self injury bites himself,hits head,breaks windows. pulled a chunk of hair out of my head and has bitten me causing severe pain and scarring
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	nonverbal so uses sign language but increased chances of frustration because others don't know or understand what he wants
What additional research is needed to help address co-occurring conditions for autistic people?	medicine that is safe in children and has less long term side effects
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	psychiatry available and knowledgeable about autism and mental health conditions with it. more school day programs and residential options. paying staff well and educating in care for the disabled individuals
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	my daughter was very social before covid but such a long time with masks and separation from others took that away. She has never returned to the social butterfly she was. just starting to improve recently
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Staff stopped working with individuals during covid and staffing has never recovered. People can make more money at mcdonalds. remote education doesn't work in autism. totally ineffective. no day programs available for my son who has aged out of school and is sitting home doing nothing.

Name	Dave, A citizen from Oregon
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	<p>Dear National Institutes of Health, I write to share my struggles with autism, epilepsy, severe sleep disturbances, and sensory issues. These affect my communication, privacy, and work life significantly. Explaining health issues is a major challenge. For instance, mentioning a generalized seizure is often necessary to justify absences, requiring detailed explanations unfamiliar to most. This issue extends to the workplace, especially when seeking ADA accommodations. The process often feels like a battle, making it hard to ask for what I truly need without feeling cornered into accepting less. Moreover, epilepsy-related executive function deficits limit my economic contributions. In a predominantly able-bodied world, these challenges are magnified. Autism affects communication, so clear understanding of my needs, like missing events due to seizure risks, is vital. When these are overlooked, it exacerbates my struggles. I urge you to consider these experiences in your research and policy-making. Understanding the unique challenges of co-occurring conditions like autism and epilepsy is essential for a more inclusive society. Thank you for considering my perspective.</p> <p>Sincerely, Dave</p>
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	<p>To Whom It May Concern, I am reaching out to share my lifelong journey with autism, epilepsy, anxiety, depression, and ADHD. These conditions intertwine in complex ways, deeply impacting my daily life. My autism has led to social isolation, intensifying my depression. Additionally, the interplay between seizures from epilepsy and ADHD symptoms creates unique challenges. Frequent focal seizures disrupt my focus, and when combined with ADHD, it becomes increasingly difficult to complete tasks. This struggle is often misunderstood, especially in social interactions. Communicating effectively is a hurdle due to my autism, leading to skepticism when I explain issues like memory lapses caused by seizures. There's a significant distinction between having a disability and being disabled. A disability doesn't always lead to debilitation unless it hinders one's ability to live life as desired. In my experience, autism often shifts my other conditions from mere disabilities to a state of being disabled. It amplifies the difficulties I face, turning manageable issues into significant obstacles. I hope this insight helps in understanding the multifaceted nature of living with multiple co-occurring conditions. Recognizing and addressing these complexities is crucial for providing better support and fostering a more inclusive environment. Thank you for your attention to this matter.</p>
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	<p>There needs to be evidence, and easily accessible literature around 1. antecedent interventions in epilepsy. like https://www.tandfonline.com/doi/abs/10.1080/028457199439955 In my life there is a Skinner paper on the possibility of antecedent behavioral interventions can help with epilepsy, this study is an expansion but doesn't go far enough, the science needs further exploration - this hits the nexus between epilepsy and autism in that most treatment for autism is based in behaviorism 2. Some work needs to be done to figure out better tools for job hunting for this cohort. Low paying, stressful, ill fit, and mismatched jobs</p>

	<p>lead to a reduction in the health and well-being of folks experiencing these challenges. That is a health crisis. Researching what happens when the job acquisition process is handled for the subject/patient/autistic person and seeing what happens to their quality of work would be useful. It would also be interesting to see what happens to their earnings v. their allistic or fellow autistic cohort.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Career Placement and Housing first.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>It set me back 6 months on fitness training, it worsened social isolation, it increased anxiety, and the fighting to get insurance to pay for the missing time was terrific, and was made harder by the executive function issues. I had an enormous number of focal and complex partial seizures caused by the infection, and I still am not back to baseline for respiratory health three months later. Beyond that, it has made networking to advance my career much harder, even in the face of the extraordinary challenges that already exist for folks with disabilities. The social isolation and failures of institutions worsened anxiety - seeing the government be inaccurate repeatedly, and the social instability caused by people pretending science didn't exist, seeing 1/5 of americans just call the deaths of the weakest among us an inconvenience, and throw violent tantrums because they couldn't get their hair cut. I live in a nation less safe for me and folks like me than it was 10 years ago.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>On the up side - Remote work has been life changing in so many positive ways. It gives me the opportunity to better manage my epilepsy and do so more responsibly. It allows me to control how much human interaction I am required to have. My institutional trust has been devastated by half of the government showing that they are nudging genocidal by minimizing the deaths of millions of americans because they weren't "The right kind" I feel less safe in public. Particularly when masking. I experience belligerence and denial of access to some businesses because I am wearing a mask, and folks only care because it got politicized by losers. I feel as though the actions of the government during covid emboldened the worst of our society, and I look back at the folks Nazi's started killing and I check more than one of those boxes. The government's complete failure in these matters has worsened my life immeasurably and killed millions. The psychological and social impact of these things cannot be overstated. It is the responsibility of elected officials to act like adults. Their failure to do so endangered and killed millions.</p>

Name	David
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues. Smell. Taste. Touch. Over react to loud noises. May be trauma. Sleep issues. Often average 3 to 4 hours pn for extended periods
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Professionally Diagnosed Cptsd Ocd Bipolar Adhd Social anxiety Suspect Pathological demand avoidance Rejection sensitivity
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication my biggest problem. Excel at intellectual by myself. Understanding and being understood tough for me
What additional research is needed to help address co-occurring conditions for autistic people?	I think I was diagnosed in wrong order. Only recently autism but many of my earlier diagnosies may have been due to my behaviors caused by autism. Suspect trauma (cptsd) centered in struggling as autist. All anxiety. Not sure if bipolar mere symptom of my autism but working with docs to establish
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Everything. Healthcare companies dont take seriously and even some providers. Get far more help from peers. I suspect addressing autism more proactively will actually reduce mh costs due to other morbidities that result or misdiagnosis.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I was only diagnosed post covid. But the extra frustrations from covid brought out the worse in my autistic self as things even more chaotic and illogical than normal
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I was working remotely before. Less socializing work of otherwise, was actually easier for me.

Name	David Gartland, Father
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory Issues Sleep Disorders
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD Anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities Developmental disabilities Intellectual disabilities Communication disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Early Diagnosis Sensory issues Causes of autism Cure for autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Doctors acceptance and patience with unique autistic behaviors
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Stopped working due to COVID-19 and never got reemployed Remains at home 24/7

Name	David Grady, California State Council on Developmental Disabilities, Central Coast
Demographic	Representative of advocacy organization; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	All issues are important. Also important to consider is the severity of the autism diagnosis. Reports of sleep disorders and its impact on family is significant, but dietary needs/restrictions, behaviors that have a link to obsessive compulsive disorder needs consideration.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Co-occurrence is significant. Data about co-occurrence is limited and scarce. The issues are complex and interrelated. Autism awareness is required by crisis response and intervention, de-escalation, 988 and 911 responses, particularly by underserved populations, and appropriate documentation need addressing. Psychiatric holds, emergency room, transitional housing needs to be adapted to the population. Community awareness building is essential, is needed to shift thinking to those with autism also have behavioral health needs. Special and General Education need to address bullying and other trauma experienced in school and community settings. Education programs and clinicians need training and develop to offer treatment. Research needs to identify the most appropriate levels of care. Language needs to be developed around the levels of autism, with recognition that those with autism Level 3 have requires levels of support often including family, different than those with Level 1.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Recognition that some behaviors might be compensatory and necessary as a coping mechanism. Recognition that ABA might be enhanced with application of social learning theory. Recognition that intervention and treatment modalities may differ for those with autism. Recognition that many behaviors might be associated with anxiety and treatment interventions should include stress management. Development of best practices that promote inclusion, and socialization with others including that without an autism diagnosis.
What additional research is needed to help address co-occurring conditions for autistic people?	Causation. Social Learning vs. ABA. Best practices in treatment & stress management. Vocation development and training. Importance of early diagnosis and intervention.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Person Centered intervention. Vocational Discovery. Peer and ambassador programs. Community Awareness Building. Celebration of the Autism Identity.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Advantages and disadvantages of virtual education. Over-reliance on technology (social media) and how it might lead to isolation. Inconsistent special education practice. Impact on school attendance.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	All types of intervention needs to be individualized. For each improvement in response to Covid and the current culture, there may be an equal and opposite set of disadvantages. For example use of gaming as a reward or stress reduction technique can lead to a dependency that is counter productive.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	David Kaufer, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	1) Motor challenges 2) GI disorders 3) Sleep disturbances (usually tied to GI disorders it seems) 4) Sensory 5) Epilepsy/Seizures
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge caused by motor issues is that it makes communication very difficult for many individuals on the Autism Spectrum. Many are non-speakers and this, combined with their motor/sensory challenges, creates a brain/body disconnect that doesn't allow them to accurately/reliably take standardized tests. So they are inaccurately labeled as cognitively deficient and placed into intensive ed programs - even though their cognitive skills are strong. They need support with AAC devices and support for training/communication partners.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities is the key problem in my opinion. The inability to speak/communicate reliably creates a number of problems/assumptions that harms the individual. Our son was diagnosed with an intellectual disability - but he is now taking high school algebra and other courses.
What additional research is needed to help address co-occurring conditions for autistic people?	We need research demonstrating that spelling-based communication is credible and reliable. There are thousands of case studies now of spellers who have been able to communicate for the first time (and demonstrate their intellectual capabilities) but there is a very vocal minority who opposes this methodology that is trying to discredit this population with outdated and misleading statistics in a propaganda campaign. We need credible organizations/institutions conducting research that shows that this population is clearly capable of independent thoughts/responses.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Greater support for schools to provide individualized assistance to students in need.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	None for us.

Name	David McWaters
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	1. Diminished mental and emotional resiliency that limits time able to do tasks and perform work tasks 2. Dysgraphia affecting ability to write
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	1. Executive functioning disability resulting in inability to keep things clean, organized, and tidy 2. Anxiety over minor health episodes and injuries 3. Excessive shyness making finding friends difficult
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	1. Executive function disability affecting ability to focus and take organized notes in class
What additional research is needed to help address co-occurring conditions for autistic people?	Need a new focus on adults with autism living in society and working for a living wage
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Social interaction can be difficult in the best of circumstances and for many became impossible during the pandemic
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Dawn Werner
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GASTROINTESTINAL DISORDERS
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ANXIETY
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	ALL OF THE ABOVE
What additional research is needed to help address co-occurring conditions for autistic people?	I don't know where to begin with this one. As a parent of an autistic child I "know" these conditions are "co-occurring" but only because I've read it online, but we've never had much help or success on how to improve the conditions or how to help navigate it.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better access to care. Appointment times take forever and many doctors aren't much help. Better insurance coverage to gain a diagnosis.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Day, Autistic, ADHD, Dyslexia, and co
Demographic	Autistic individual; Representative of advocacy organization; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	sensory- constantly overwhelmed and overbearing feeling sleep disturbances- causes extreme fatigue or insomnia motor challenges- shakes, twitches, paralysis gastrointestinal disorders
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	attention-deficit hyperactivity disorder, anxiety, OCD, ticks
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	dyslexia, migraines, Tremors, dissociation
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to and accessibility of services, insurance coverage, service system issues, patient-provider interactions
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	harder to mask or function regularly in public
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	people are more aware of their health so, make it safer for me and mine, i was forced to mask less so now i can breath, triggered my tics are more noticeable and paralysis worsen

Name	Dean
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Being able to communicate these difficulties to a doctor. Being able to engage in therapy
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am partially sighted, have cerebellar palsy, borderline learning difficulties and PDA. By far the most disabling of these co-occurring conditions is PDA. It stops me functioning and very few people understand
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	PDA means I cannot do things I want to - I haven't bathed or washed my hair in a year. It took me months to get my hair cut. I don't take medication that literally keeps me alive because of pda.
What additional research is needed to help address co-occurring conditions for autistic people?	We need to focus a lot of research on pda - it is crippling and costs the country a fortune - 70 % of children with pda cannot access school. Pda ers often end up in institutions or needing round the clock support yet it still isn't diagnosed in most areas.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	PDA diagnosis being widely available. PDA awareness and training for all healthcare professionals
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	It was good when social stuff like church and also appointments were online but as soon as Covid was done they went back to face to face and autistic people were excluded again. Need the choice of online or face to face.

Name	Deb
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy - adherence with medication administration Fibromyalgia & Osteoarthritis - pain management and reliable assistance as needed
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Attention deficit - teaching new skills need to be small steps at a time Anxiety - maintaining scheduled routine with teaching on dealing with interruptions as life deals
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communications- Daily calls to check on status. Provide support and patience. Encourage with open ended questions.
What additional research is needed to help address co-occurring conditions for autistic people?	Survey mailings to autistic individual households and provide opportunity for questions, support.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Improved Accessibility to insurance covered services
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Less accessibility for person to person assessment for planning, teaching, supporting and arranging services
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Reduced person to person interactions

Name	Deb
Demographic	Family member of an autistic individual

Name	Deborah Bilder, University of Utah Huntsman Mental Health Institute
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Mental health crises have a substantial impact on the well-being of autistic individuals. For children and autistic adults with high support needs, this impact extends to the affected person's family and caregivers. Psychiatric and physical conditions contribute to crises, yet most medical providers are poorly-prepared to evaluate the broad range of conditions that could be causing or exacerbating crises. While agitation, aggression, and self-injury are not core features of autism, autistic people presenting in crisis are at risk for disruptive behaviors to be attributed to autism rather than being evaluated for underlying medical and psychiatric disorders. The Sources of Distress Survey (SDS) is a screening questionnaire developed and validated to assess individuals with neurodevelopmental conditions presenting in crisis. Using online, branching logic, the SDS extends the breadth of symptoms that can be screened. It has been used over 500 times in medical settings. The most profound effect of SDS's clinical use occurred from identifying discrepancies between medications prescribed and psychiatric disorders present: > 50% of individuals with severe psychiatric disorders were taking medications that likely worsened these conditions. Over 70% had insufficiently treated medical problems that could contribute to crisis. Further refinement of SDS items and algorithms is ongoing. A prospective evaluation of its impact is needed to extend its use and inform standards of care.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	A prospective evaluation of screening tools for mental and physical health conditions in autistic people presenting in crisis is greatly needed. Additionally, measuring their impact on assessment results, treatment recommendations, and clinical outcomes will inform policy and standards of care.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Improvement of crisis evaluations by medical providers.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Deborah Gill
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	When sensory issues trigger aggressive behavior it is difficult to help my son manage his behaviors. He is often triggered by rain which we cannot control. He also is frequently up a lot at night which is hard on his staff in supported living and even harder on us when he lives with us as we still need to work the next day.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Keeping him safe and keeping staff to work with him are the most significant challenges. He has had very significant anxiety which triggers aggression and self-injury behaviors. Because of limited verbal ability he cannot participate in regular mental health treatment for anxiety. As a licensed Marriage and Family Therapist I know those treatments well and do use them with individuals with ASD who do not have the intellectual disability and language disabilities my son has. We have used ABA but it is also of limited use. When he is anxious he has behaviors. This has caused him to have a revolving door of caregivers. It is extremely difficult to create a stable, well trained in his PBSP staff at his house.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	His intellectual disabilities paired with his Autism means those around him need to be trained to help him manage his emotions and behaviors. He needs the support. But his staff is paid so poorly that they leave quickly and we cannot keep the staff adequately trained to support him. This is not a low skill job!
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better pay and training for support staff. Better day services to engage him. When he is bored he acts out.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My son was so isolated and bored during Covid that he developed aggression for the first time in his life. He was nearly 30 when this happened. He became very anxious and self injurious, also much more than prior to Covid.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	He is still very isolated and unable to work or have an interesting full life.

Name	Debra Yurschak, NCSA member
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son [PII redacted] is 22 and his significant challenges caused by co-occurring conditions include everything mentioned plus self injurious behaviors & sudden loud explosive outbursts which is his common response to these challenges. These make it difficult for [PII redacted] & his caregivers (me) to participate in our community, visit the grocery store, go to church, visit family & friends, etc. All of that but especially GI disorders, sleep disturbance, & sensory challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son [PII redacted]'s (age 22) most significant challenges caused by co-occurring mental health conditions include everything mentioned except suicide but especially self injury, aggression & anxiety. We struggle to find effective psychiatric treatment such as meditation for these conditions. My son has been on several medications since age 10.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son [PII redacted]'s most significant challenges along with autism include intellectual disability, global deficits in all areas including speech, OT, self care, activities of daily living, self advocacy, etc. He is mostly nonverbal and also refuses to use a communication device or a PECS system as both make him anxious & cause meltdowns. He is dependent on caregivers for almost everything. Severe frustration when my son can't communicate his needs which leads to self injury, aggression & property destruction
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	State & federal laws should allow employers of record to be added as paid staff since they are the ones who do the bulk of caregiving for their individuals. Also all name brand medications should be covered by insurance vs mostly generic for those with stubborn to treat behaviors that don't respond to generic meds. Also insurance should cover a yearly MRI, CT Scan, X-rays as part of their annual physical for those with severe self injurious behaviors & pica to catch broken bones, swallowed objects, brain injuries & other physical conditions caused by the individual that could be causing chronic pain. Self injury is more often than not a sign of chronic pain. It is also a cry for help and should be taken seriously by doctors. Usually they won't order additional testing because of insurance. Only the most wealthy can request any and all tests and pay out of pocket for these tests for their individuals to rule out anything physical. Same as any thoroughbred owner would do for a prized racehorse. Humans deserve the same treatment, in fact to give better medical treatment & care to animals over human beings seems a tad unethical, if not borderline illegal. More respite providers, weekend camps, more day programs that don't exclude because individual needs 1:1 support
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	Negative. Programs like Kennedy Collective have greatly reduced the number of program locations following COVID shutdown. My son's autism school Giant Steps School closed permanently because of COVID. Far fewer day

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

program opportunities & many do not accept participants who need 1:1 support. Hours of operation for day programs are shorter. My son does not have transportation to his program in Wallingford. We live in Milford.

Name	Delia Ruiz
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My 10yr has sensory challenges. He constantly has to smell my cheek or my pillow. I have been unable to find resources or any types of supports or replacement behaviors. It can be frustrating for me and embarrassing for him.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD has been challenging for my son. He struggles to sit still and has had injuries due to this, ie falling off chairs and beds.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities has lead to behavioral challenges for my son.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to and services and insurance coverage and high quality parent trainings.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Deon
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GI issues have caused sensory issues, but because GI issues were constant I didn't realize something was actually wrong until almost 30. I've developed ARFID due to long term sensory issues with food possibly due to unconsciously labling foods as unsavory because of GI upset
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I've been misdiagnosed as depressed and anxious my whole life, when those are only symptoms of undiagnosed autism and ADHD. I didn't know I was autistic until my mother informed me at the age of 26, she refused an official diagnosis when I was young. I've dropped out of college twice, and I know if I'd been diagnosed I would have grown up with the correct supports I needed and would have been better able to succeed. I've struggled with self-harm since I was about 8. I believe this is in part due to undiagnosed AuDHD and also a religious upbringing while being a closeted queer child.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Comorbidities. ADHD both goes hand in hand with my autism and contradicts it (ADHD wants spontaneity but ASD needs structure and routine to thrive). EDS is another common comorbidity that causes a lot of body pain and can sometimes make physical exertion harder than it already is. GI issues are also common, I personally have Celiac disease
What additional research is needed to help address co-occurring conditions for autistic people?	Research about common autoimmune diseases within autistic communities
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Care-providers should listen to autistic people and get information from autistic educators whenever possible. Often times I see a sense of superiority from doctors when discussing autism and they act like they know more about autism than those actually experiencing it.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increased fatigue and inability to perform basic tasks necessary for daily living. Far more dependent on others for basic needs. More avoidant of people/infection
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased isolation as a result of more remote interactions. Decreased tolerance for sensory input. Increased emotional overstimulation due to more time spent online

Name	Devorah, mother
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	anxiety, social challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	learning challenges especially reading comprehension
What additional research is needed to help address co-occurring conditions for autistic people?	research on medications and treatment for moderate to severe anxiety, the first line ssri have terrible side effects and many others as well.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	ABA as a related service that is covered by the school district is desperately needed, education to teachers in schools both private and public about autism especially the high functioning kids how to address behaviors how to help the kids navigate school and social integration withing the school setting. I would love to see coaches in schools to be a point of contact for staff and the child.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	loss of year of therapy and learning
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	ability to do remote work and therapy

Name	Diana Gonzalez Madin
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbance, anxiety and sensory challenges are the most challenging.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	anxiety, ADHD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	communication disabilities, not being able to socially connect with people although connection is desired and looked for.
What additional research is needed to help address co-occurring conditions for autistic people?	Genetic factors to discard or analyze the origin of the condition and confirm whether or not can be treated.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	the social/communication progress was affected during COVID
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	reduce in person social interactions and obligations

Name	Dongmei Li
Demographic	Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Linguistic intelligence is one kind of human's multiple intelligences. Language development is very important, especially when a child is young, because a child's language develops along with his/her brain /cognitive development. Without language competence, children will not be able to learn new things, and without language competence, children will never be fully competent communicators. That is why almost all students with special needs are accompanied with language problems.
What additional research is needed to help address co-occurring conditions for autistic people?	A person's brain weight develops primarily during the first three years of life. Babies are equipped with hearing at birth, even in the mother's womb, and officially begin to speak between 1 and 3 years old. For young children without congenital hearing diseases, autism and input language errors, confusion, and language input It is related to insufficient input volume and incorrect language input method. Once a child develops language problems, it will in turn affect intellectual development, social problems and psychological problems. This challenge is particularly acute for bilingual children. I am opposed to prematurely labeling children as autistic. I believe that bilingual children whose English development is delayed due to unfamiliarity with English and are labeled as autistic are pseudo-autistic. I believe that because public school education in the United States begins at the age of 5, strengthening research on effective language input for children under 5 years old and improving related education and government strategies are the most effective ways to avoid childhood autism and adult psychological problems.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I think family care should be promoted for children aged 0-3, and I recommend a set of English DVD textbooks designed by Harvard University - Disney-world of language; and 3 years old is a critical period for children to begin to adapt to society, so I advocate that The age of compulsory education is raised from 5 years old to 3 years old, ensuring that children, especially bilingual children, can enter full-day preschool from the age of three.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Donna Costello, Private practice. Retired from public school as school psychologist working with students K - 12 with what was formerly known as Asperger's
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Significant sensory sensitivity which tend to diminish with age since family/school personnel stop trying to force the individual to deal with noise, lights, fabrics, et al. Lots of gastrointestinal issues noted, almost like some kind of autoimmune disorder. Often have sleep disturbances - worse when autism co- occurs with ADHD.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Undiagnosed ADHD as well as diagnosed ADHD. Given that ADHD doesn't hang out alone, there is a significant amount of anxiety and depression. Research suggests that individuals with ADHD have worse problems with attention and focus. Those with ADHD have more issue with planning.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication. Most individuals with higher levels of intelligence have average to above average language skills, assessed as vocabulary et al. Many educational speech and language therapists do not look at social aspects of communication, although this is changing. Interesting, when I get a possible autism assessment, not all school districts include a Speech and Language assessment if the student has a good vocabulary.
What additional research is needed to help address co-occurring conditions for autistic people?	More research on assessment of autism of students with high levels of intelligence, especially in girls who present differently. Also, research on assessment of high intelligence in adults w/ autism, that includes functional assessment of daily living. I assessed a 22 yr old woman with verbal IQ of 160, perceptual IQ of 145, with co- occurring ADHD, depression, high levels of anxiety, who could hardly get out of bed, work at a low level job, etc. The discrepancy between her high level of intelligence and poor functioning in everyday life was debilitating. AND it was impossible to find supports and services for her that were affordable for her and/ or her family. We need more support and services, similar to what is offered to those with intellectual disabilities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for one on one coaching and other services for developing daily living skills for independent living, plus career counseling and support. Most important are service providers who comprehend the depth of the underlying issues that renders a high intelligence individual with suboptimal to poor functioning in everyday life. These individuals have amassed much specialized knowledge and could be supported to be productive in their areas of speciality. They want the support.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My client dropped out of college one year from graduation during the pandemic due to isolation. It was actually easier (more motivating) for her to get to class, focus, and complete assignments (mostly papers) in person than online.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic	Reduced in-person social interactions - although social communication is an area of deficit, there was an expectation that the AS individual had to be around others and required them to rise to the occasion (so to speak). The isolation resulted in a loss of social communication skills due to lack of

people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

opportunity for something that was difficult to deal with, making it easier to opt out and stay alone. I noted lots of deterioration. I worked with a group of 8 students/ families from K - 12 and college. I still am in communication with some of them.

Name	Donna Johnson, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges and sleep disturbances
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, hyperactivity, aggressive or self-injurious behavior, and obsessive compulsion disorder
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	executive planning, communication and developmental disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Research on the impact of challenges with executive planning disorder
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services to support young adults and adults who receive a late diagnosis and missed the window of opportunities that exist for younger children. Training workforce to support youth and young adults who receive a late diagnosis when the manifestation of symptoms appears to be more visible (e.g., depression, anxiety, executive planning disorder) System of services challenges
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 has had a lasting impact on co-occurring conditions such as anxiety, depression, sleep disturbances, and executive planning.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Social changes related to reduced in-person social interactions exacerbated isolation for autistic individuals. Making the transition back to being socially engaged is a challenge and in some instances caused a setback of gains previously made for autistic individuals. The impact of being in isolation has also caused increased anxiety and depression as autistic individuals readjust and navigate their environment.

Name	Donna Narey
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Being nonverbal and having issues with sensory processing is very difficult. When your child cannot express what he is feeling and cannot process that feeling at the same time it is very frustrating!
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	In addition to the autism and down syndrome, my son has ADHD and anxiety. The anxiety causes him to become overwhelmed, and ADHD causes impulsiveness, which then leads to expressing his anxiety by scratching anyone in his space.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Besides autism, my son has Down syndrome, which combined causes his developmental age to be between one and three years despite being 18 years old.
What additional research is needed to help address co-occurring conditions for autistic people?	Not sure.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I think equitable access to services. My son doesn't fit in the Down syndrome world, and he doesn't fit in the autism world. Services tend to be for one diagnosis or another.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	thankfully, my son School realized that zoom didn't work for him and brought him and a few other kids back in person while keeping the majority of kids online. Now most things seem back to pre-covid.

Name	Doreene Donald
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Hyperactive disorder
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disability
What additional research is needed to help address co-occurring conditions for autistic people?	There should be more programs that help parents with kids who are autistic
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for aba therapy plus more help to help parents rest sometimes. Parents with autistic kids most of us don't rest. There should be counseling for parents with autistic kids
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Dr Christopher Pyne and Holly Swan, Parents
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Our son has not slept through the night but possibly once or twice a year since he was a baby. He is now 26. He wakes every night and is up for a couple hours, so we are up. He walked in the house today and fell asleep in a matter of minutes because he is so sleep deprived. This causes the sensory issues (needs trampoline, etc inside and outside) to be even more extreme as well as his motor challenges.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	One of the more significant challenges is his self injury (with medicine , he has not been aggressive for a few years) but he is currently bruised all over his right arm and some on his chest from his pinching self so hard when he upset. He is so hyper it is hard to do things with him as he has to jump around so much.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	He is profoundly autistic and does not have much communication at all. It is extremely worrisome as he ages and can't tell us when he doesn't feel good/something is the matter or is constipated or has a headache. Or if someone has hurt him. It is heart breaking.
What additional research is needed to help address co-occurring conditions for autistic people?	Where is the research explaining the tsunami of autistic young people that is obviously growing at a frightening rate???
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Until we start paying people equitable rates to help our guys, there will not be trained people to work in this field or help our guys in a way they deserve, rather than pay employees less wages than those who serve us at McDonalds.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It has made hiring people to work in this field even more difficult, thus, many with autism haven't even been able to get the services that have been PROMISED to them.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Our son cannot easily sit still so he could not really participate in virtual learning. And would add his hard earned skills regressed.

Name	Dr Jessica Myszak, Help and Healing Center PLLC
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Unspecified auto-immune conditions, Ehlers Danlos and other hypermobility problems, POTS, IBS, sensory sensitivities (including ARFID) are all areas of significant concern for many autistic people and need more attention and research. Because some of these conditions are difficult to assess for and treat, many people experience these conditions and have no idea why, or that it can be related to autism. These can impact a person's ability to maintain employment and meet their financial needs, thus putting them in an even more precarious position.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression are huge areas that are often present in autistic people, and these can worsen during autistic burnout, even to the point of suicide. Trauma often co-occurs, and it is likely that autistic people are more likely to experience both acute and complex trauma. There needs to be far more attention paid to autistic burnout and masking. These can impact a person's ability to maintain employment and meet their financial needs, thus putting them in an even more precarious position.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Many of the conditions that can co-occur with autism negatively impact a person's ability to maintain employment and meet their financial needs, thus putting them in an even more precarious position. This is why appropriate supports are so important, and why a safety net would be important for our community.
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be much more research on autistic adults, and the supports needed over the lifespan. Research on masking, PDA, the impact of an affirming environment, the impact of various supports should be considered. Even more important, this information needs to be disseminated to providers and trainees that work with autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All areas of autism services and supports could be improved to better support children, adults, and families of autistic people. Currently, waiver programs are inequitable across states and have very long wait times for services. Because of the variability in individual needs, the offered services are not always what is needed by the individual. Services and supports for adults are minimal for all but the most significantly impacted individuals.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 infection and illness has created more isolation for many autistic people, and added yet another layer of challenge onto a community of people who already experience numerous additional obstacles to societal participation.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	For many autistic people, COVID-19 was a turning point in one way or another. For some people, the loss of existing structure and supports was terribly difficult and resulted in losses in functioning. For older autistic people with fewer support needs, the increase in access to telehealth and reduced in-person requirements. Many of my clients have thrived with remote work.

Name	Dr. Autumn Dae Miller
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The assumptions that service provider staff make regarding behaviors/actions as a choice rather than seeing them as expressions of excruciating pain and discomfort related to digestion, exhaustion from sleep disturbance, and unbelievably irritating sensations from movements that bodies need to make. It's not JUST the physical health experiences, it's that professionals honestly believe there is a way to "just get through it and move on" that Autistic people are choosing not to do for the sake of making that person's day more complicated.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	1) The DSM-5-TR and the DM-ID-2 are both extremely limited. They were written by people without lived experiences and therefore can only be taken as books of assumptions based on assumptions. 2) Psychiatrists-by and large-are not diagnosing using the most updated versions of the DSM nor are they doing copious amounts of research on new caveats to mental health diagnoses and their treatments. 3) Most evaluations are 10+ years old and professionals refuse to take a FRESH look at a person; however, we all change and so do our experiences. It's a harmful practice. 4) We COMPLETELY miss how trauma masks other symptoms and shifts the way co-occurring MH presents in anyone! 5) Autism can quiet typical MH symptoms and exacerbate others. What looks like X in theory can be expressed very differently in an Autistic client.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenge in this arena is that people supporting this person assume the following: 1) That this person is somehow always going to be childlike, which is absurd. 2) With that, that this person is not able to safely navigate social, romantic, employment-based, etc. relationships because of these "childlike" assumptions (also untrue). 3) That there is something WRONG with this person so they are unable to learn. This one is extremely problematic as it perpetuates the assumption that someone is expected to learn in ONE way - the way the EDUCATOR WANTS TO TEACH; rather than meeting each person where THEY are and teaching them using the methods that work best for them.
What additional research is needed to help address co-occurring conditions for autistic people?	Let's first look at WHO is doing the research, who is FUNDING the research, and HOW that information is going to be used. Once that is completely transparent and confirmed for the good of humanity rather than the perpetuation of stereotypes, then the following research foci would be helpful: 1) The effect of holistic bio-psycho-social treatments working in tandem to support Autistic people with health needs of any sort. 2) More research on Autistic Adults! People don't STOP being Autistic at 21! 3) Trauma and Autistic survivors 4) The effects of big-pharma psychotropics as compared to supplemental (natural) medications on neurodivergent brains to see what is ACTUALLY most beneficial for anyone with co-occurring mental health diagnoses and what the long-term effects of those medications are on the body and mind.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	1) Stop antiquated forms of ABA services (we have to stop telling people it's ok to force someone not to be themselves when we know this has caused physical and emotional pain). 2) Create & fund programs that have combination skills including professionals with LIVED EXPERIENCE where insurance and/or waiver funding can be tapped that would support the need for bio-psycho-social centers (NOT antiquated inpatient hospitals who do NOT know how to support Autistic clients or typical ERs that restrain clients they cannot chemically control) where folks would be able to safely seek NEURODIVERGENT-AFFIRMING support...this has NEVER been done outside

	<p>of the "private pay/elitist-funded" world. 3) Requirements that ALL providers who say they offer services to Autistic clients to go through training run by Autistic individuals every year with regulatory requirements based on the parameters of that care. Ex: If you say you serve Autistic clients at this ER, your response to someone who needs to scream and run when touched better not be to tie them down and give them IM injections!</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>You are asking what COVID-19 has done to physical and mental health for Autistic people...similar to what it gave & took away & made messy for everyone... 1) Remote work: finally people got the chance to work from home...where the food I can eat is, where bathrooms that feel safe are...where I can move, jump, fiddle with a fidget and not be judged. This has completely changed the game and made it possible for people to be more authentic and safe(r). 2) People are so stressed with the way the world is these days, the expectations are off the charts (do more with less than half of what you had before...of everything), and we expect folks to just KNOW how to survive it all. 3) For those who DO reach out for help, the BEST providers refuse to put up with the harassment and belittlement of insurance-funding or waiver-funding. To get the best, you have to bit rich and that's absurd in a world where those who need the most qualified cannot access them. It's not the fault of the therapist who would only get paid \$45/hour from Medicare when their time is worth \$150-\$250/hour elsewhere. They went to school, they have bills to pay, and the clients NEED them. COVID showed us that we treat the people our world needs the most like crap; hospital workers, therapists, teachers, human service workers in general...this negatively impacted us all.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I'll answer just as an Autistic person and not with my professional hat on. I'm tired of people PRETENDING that actions that taken during pandemic and as part of the ongoing COVID19 effects were JUST because of a virus. A huge part of the last few years of our lives is that we also realized that: black lives STILL didn't matter and they MUST, people only value helping professions because they don't want to DEAL with the messiness of humanity themselves, that wars are happening and our country is too stubborn to care about any other humans unless it directly benefits them or makes for a great social media campaign, that people still do not believe WE are having a negative impact on the health of our planet, and that disability as a whole is a social construct where someone is only DIS-abled because society doesn't accept, adapt, and appreciate the all-natural variety of humanity. The worst part during COVID-19 is that we learned large parts of our country HATE anything that is different. I'm different. I've always been different. I thought that was a STRENGTH in this world but so many people said no, we hate you because of that and all your other identities. THIS is what affects my MH, my physical health, and the health of all the people I love and care about - even those I've yet to meet. Remote work is great; social media is a space where those without microphones in their faces can be recognized, and hate has no place here. Thank you.</p>

What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	For more of my life than not, I have been the bad guy, and it didn't have to be this way. One of the major findings of my PhD dissertation, about sociosexual ecologies in the algorithmic age, was neuroqueer self-realizations on platforms, like TikTok. This summer, I published books about why there are massive queerness and neurotype (in other words, neuroqueer) self-realizations happening. Within the last 10-15 years research has shown that millions, if not billions, of AFAB (assigned "female" at birth [ideas of "biological sex" and "gender" are built through language usage]) autists have been missed, and the world is still too discriminatory for us to safely be open about our neuroqueernesses. We also have high rates of substance abuse, 9 out of 10 AFAB autists experience sexual violence, and we have exceptionally higher likelihoods of suicidality. Research shows that, especially Black and Brown AFAB folks, are dreadfully undiagnosed, leading to additional

	<p>discrimination(s) and unemployment. Whether formally diagnosed or not, many autistic individuals are also high risk for significant health complications, including severe (short and long forms of) COVID-19. And, many, likely don't even know it, due to self-advocacy challenges and/or normalized medical gaslighting. Our community is not a hivemind. Many of us, however, have exchanged unprecedented solidarity regarding uncanny similarities during the most connected time in human history, and changed our lives for the better.</p>

Name	Dr. Henny Kupferstein, Doogri Institute
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges is a prognosis of premature death. There is so much gaslighting by primary and specialist physicians, that autistic people often quit asking for help. As neuromuscular disorders are so prevalent, little research is done to manage the progressive decline in adulthood. For example, I can no longer toilet independently due to complete bowel dysmotility at age 37.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression and self-injurious behavior are not in the DSM-5 criteria for ASD. In fact, these are signs of PTSD. the same is true for property damage, elopement, and school shootings.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The primary diagnostic criteria of communication disability is grossly overlooked. We have a right to accommodation, but the law still requires us to communicate about our need for communication support. This is a catch-22 that any other population would not be silent about. The other concern is that generic social workers are tasked with making service decisions while lacking the expertise to review medical documentation of need; the due process is not accessible.
What additional research is needed to help address co-occurring conditions for autistic people?	There is a known trifecta of EDS, MCAD, and POTS. There is also a known comorbidity of mitochondrial diseases, and genetic metabolism errors. As long as this is not linked, we will be forced to seek out treatment from multiple specialists who do not communicate with each other, and run the risk of 'doctor shopping' or 'malingering'.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Licensed Clinical Social Workers and Medicaid Service Coordination to advocate in a case management position. The access issue is solely based on breakdowns in communication within a broken system. The autistic person shouldn't be burdened with calling to see if a referral arrived, and should benefit from service professional to ensure Timely and Appropriate access to care. We can't do it alone.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Autistic people for the most part have been surprised by the pandemic where non-autistic people were forced to adopt our lifestyle. Social distancing gives up the space to flourish. Zoom calls gives us an opportunity to have realtime captioning. Telehealth gives us an opportunity to be in our sensory friendly space while having a potentially traumatizing encounter with a generic provider.

Name	Dr. Karissa Burnett, Divergent Pathways: A Psychological Corporation
Demographic	Autistic individual; Service provider, health provider, or educator
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Co-occurring physical health conditions are prominent in the autistic community and warrant extensive research, as they exacerbate challenges across domains and significantly impact quality of life. Some of the most common physical health challenges faced by autistic people include gastrointestinal disorders (e.g., IBS), dysautonomia (e.g., POTS), mast cell activation syndrome (MCAS), hypermobile Ehlers-Danlos Syndrome (hEDS), fibromyalgia, chronic pain, myalgic encephalomyelitis / chronic fatigue syndrome (ME/CFS), autoimmune disorders, asthma, allergies, and sleep disturbances. When any of these conditions are present, physical discomfort can be amplified by autistic people with sensory sensitivities, which can include heightened interoception. When this occurs, attention tends to shift toward pain/discomfort, stress levels increase, and the bandwidth for navigating daily stressors decreases. For those with less access to interoceptive cues from within their bodies, these physical health conditions may not be as apparent until they become worse. Autistic people with limited or no speech can have difficulty sharing their physical experiences with providers, especially if the environment is not accommodating of their communication and sensory needs. Also, many autistic people describe not being listened to or believed by their providers (“medical gaslighting”), which is a major problem that is important to address through further research and education.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Many autistic people put extensive energy into “masking” their struggles to try to fit in, which can lead to misdiagnosis regarding autism and underdiagnosis of co-occurring mental health conditions. Masking also inherently means there is shame about the true self, which can lead to increased stress, anxiety, and depression. The prevailing behavioral treatment for autistic children often teaches masking and compliance, which can have significant negative impacts on their development (e.g., one study suggested that ABA correlates with increased PTSD symptoms in autistic people (Kupferstein, 2018)). Challenges in navigating neurotypical social norms can lead to and become intensified by mental health conditions, leading to increased feelings of isolation, misunderstanding, and loneliness. Sensory processing differences and challenges with emotional regulation can be exacerbated by mental health conditions (e.g., anxiety often seems to increase sensory overload, and vice versa). Finding mental health support that understands autistic people is difficult, especially through a neurodiversity-affirming lens. Traditional mental health treatments do not often consider the unique perspectives and experiences of autistic people, leading to less effective or even harmful care. It is especially rare to find providers who are able to conceptualize the nuances involved with co-occurring mental health conditions. More education is sorely needed.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>Autistic people with co-occurring learning, developmental, or intellectual disabilities may face heightened difficulties in traditional educational settings. These challenges can include struggles with information processing, memory, attention, motor coordination, and problem-solving, which may require specialized educational strategies and supports to facilitate learning in a way that works best for them. For autistic people with additional communication disabilities, expressing needs, thoughts, and feelings through speech can be particularly challenging, especially when they do not have access to alternative modes of communication (e.g., AAC). These compounded communication barriers can lead to misunderstandings,</p>

	<p>frustration, and increased difficulty in forming social connections and accessing needed support. Additionally, misconceptions and stigma surrounding these disabilities can lead to social exclusion, mistreatment, and isolation.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>A recent study from researchers in Scotland asked autistic adults what their research priorities are, which mirror what I see from the autistic community in the United States. According to these autistic adults, the least important things to research are “genetics, treatments and interventions, and cause [of autism]” (Cage et al., 2024, “What are the autism research priorities of autistic adults in Scotland?”). Instead, there is a call to research “mental health/well-being, identification and diagnosis of autistic people, support services, knowledge and attitudes toward autistic people, and issues impacting autistic women” (Cage et al., 2024). Fundamentally, research focusing on the subjective experiences of autistic people with co-occurring conditions is essential. This includes studies that prioritize the voices and perspectives of autistic people to inform practices and policies that genuinely reflect their needs. Studies that explore the impact of cultural, socioeconomic, and environmental factors on the prevalence, identification, and management of co-occurring conditions in autistic individuals are also needed. Of note, Pathological Demand Avoidance (PDA) is a unique profile of autism that has research backing in the UK but has been minimally-studied in the US. It is imperative that more research is done in this area to increase understanding and provide more effective support.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Autistic people should always be actively involved in decisions about their care. However, navigating systems of care and self-advocating can be daunting. When accommodations are not in place and environments are not affirming, challenges in communication may hinder the ability to access support. Across services, it is important to enhance accessibility, promote inclusion, and ensure that services are responsive to varied needs. Creating sensory-friendly environments across settings can make a significant difference. Training, ideally by those with lived experience, is needed for healthcare providers, educators, and support staff on autism and co-occurring conditions to improve patient-provider interactions and quality of care. Ensuring that all autistic people, regardless of their location, socioeconomic status, race, or gender, have equal access to services is crucial. This includes expanding services in underserved areas and reducing financial barriers to care. Insurance policies should be more inclusive and flexible to cover a broader range of services and interventions for autistic people with co-occurring conditions. It is imperative that the neurodiversity-affirming framework is integrated into services, and that they are covered by insurance. Currently, many insurance companies and service facilities will only accept autism assessments that use the ADOS-2, which can under-identify high-masking autistic people.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I know many autistic people who have been dealing with long-COVID, which seems to exacerbate many underlying conditions (e.g., MCAS, dysautonomia/POTS), with significant impacts on daily functioning and limited treatment options. Lingering symptoms like brain fog, chronic fatigue, and other physical and cognitive challenges can further complicate existing co-occurring conditions and impact quality of life. Additionally, autistic individuals with pre-existing mental health conditions like anxiety or depression may have experienced intensified symptoms during and following the pandemic.</p>

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>For many autistic people, the disruption of routines, social isolation, and the general uncertainty of the situation (which continues on some level) have contributed to worsening mental health conditions. However, there have also been some positive impacts from these societal changes, especially through revealing preferences/needs related to working from home, becoming more aware of social bandwidth and sensory challenges, and increasing access to neurodiversity-affirming providers through telehealth services.</p>

Name	Dr. Marcy Epstein, University of Michigan/Athena Autism
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Our diagnostic protocols need review, based on client report, especially for girls and women, BIPOC, and older people. I have gastritis and IBS and compulsion to eat as a stim. So eating disorders. I have a delayed sleep cycle of 3-5 hours, even with CPAP, Trazadone, and cannabis. Sensory issues include high volume or shrillness; not being able to smell or smelling synaesthetically; skin sensitivity to chemicals (hives and rashes) and materials (synthetics); attraction to certain food textures and unable to tolerate food smells and tastes; and most of all, needing music or solitude in order to self-regulate. Midlife onset (H)EDS; this seems to be the internal version of what's developed differently in me: I bruise, sprain, pull, and break my limbs and spine often, despite flexibility and attention. My skin is a strangely soft texture and is elastic. My hair follicles are perfectly round. Essentially, my body and brain design in all ways seems slightly off the norm. I think EDS and ASD are related. The trauma of being autistic in the world has long confused me and had an impact of my mental health. Most of us have developed full blown mental illness, spurred by this stress. We need a better understanding that ASD in itself is neurological difference, not the same as mental illness, but our experiences in this world is so difficult as to cause strain and burnout.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I'm sure that we vary. Poverty definitely plays a role in labeling without support. In every dimension. For me, I cannot seem to keep a job. Traumatic stress caught up with me, and each job takes a toll on me. I work hard, but I make people uncomfortable-- even when I've done nothing wrong. I really struggled in my career and now, I cannot see myself returning full-time to work. It's too stressful. But then how can I support myself? Some of our community really suffers from lack of real support, in their homes and in the work place, because of their aggression and injury to self/others. Also, understanding us as a variation, interesting and not always the same in our mental illness.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	We must correct the DSM for its narrow understanding of our spectrum divergence. High and low functioning needs dissolving-- i.e., my high intelligence has been hampered by unknown developmental disabilities. I learn differently. I age differently. There is so much room for more complex research. One of the worst challenges in our community is being researched without our direct representation in the research process. I've also been "managed" in clinics rather than listened to. So we tend not to seek help for ourselves enough from the allistic world, which somewhat obscures ours. So we feel despair in not being understood
What additional research is needed to help address co-occurring conditions for autistic people?	I covered this in another question, but we need a lot of new empirical, observational, and narrative research (that's my specialty) on autism itself, understanding the spectrum and our divergence, since all areas of health, including mental health, are based on a neurology, on pharmaceuticals, on a medicine based on allistic knowledge and allistic experimentation. We need research in these areas, too: autism and social difference; autism constructs in Medicine and other health fields; autism and self-immolation/addiction/compulsion; autism and early childhood, autism and aging, autism and sexuality/relationship; mental illness.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access	Much more funding for families who care for autistics, especially those with violent or aggressive reflexes. Situate autism more clearly within ADA, covering autism in its rearticulation. We need jobs and job protection. We need to afford independent living, wherein we're most at peace. We need

<p>to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>everyone trained in autism access-- allowing for non-use of telephones, giving us quiet, quick, and on-point interactions, low conflict, listening to us, not engaging in immediate dislike or rejection, microaggressions based on the perception that we are rude, etc. We need a different kind of unemployment insurance, better health coverage for diagnosis and trauma therapies, EMDR.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Overall, we've suffered along with everyone else. More people at home means more opportunities for overwhelm. Masks can make our skin break out. When we got sick, we were in a hospital emergency, in all sorts of chaos, with communications gaps and highly variable pain thresholds. For the first two years, I was glad to be home, though, because I finally could do some overdo calming. But I had some major traumas, too, and every change from routine felt scary. I got Covid at the end of Year 2, and it came with terrible gastritis and brain fog. I still have flareups and don't know if it's all post-Covid or part of my autism journey.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Everyone in clinical health is exhausted and less patient with us. It's harder to see psychiatrists and neurologists. It's been impossible to get Autism-HEDS diagnosed because of instability in the field. For me, I've become so stressed out that I feel safe mainly at home. The public feels less thoughtful, more hostile, less hopeful, and inconsolable. Positive impact? For a while, the world felt quieter.</p>

Name	Dulce
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances, sensory issues, motor control caused by spasms, muscle and joint pain, the inability tell internally what's wrong, and fatigue both mentally and physically.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, ADHD, complex post traumatic stress disorder and suicidal ideation is common but not always in tandem.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities such as due to sensory issues seem to be a common occurrence within the autistic community. As well as a few learning disabilities like dyslexia and dyscalculia.
What additional research is needed to help address co-occurring conditions for autistic people?	Treatment and support for autistic children and adults with other genetic disorders that seem to be linked to autism such as: Ehlers Danos Syndrome, it's umbrella subtypes and comorbidities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Provide sensory bins so autistic individuals can stim without stigma, ear plugs for sensory overload, and access to a weighted blanket or stuffed animal. Make ear plugs weighted blankets and sensory items available to be covered under insurance or HSA. And optionally provide tablets with communication capabilities for partially mute and fully mute individuals.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID has overall been good to us mentally due to the physical masks and physical distance we don't have to mentally mask and preform for all the steps of regular socializing. Though physically infection and illness has rendered many of us with significant chronic conditions like POTS, ME/CFS when many have not had them beforehand.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Most of the societal impacts caused by COVID-19 have been positive throughout the community since we don't have to be around a lot of people in person. Though in the beginning the disruption of services especially within the medical system was not ideal when it came to needing help with therapy for example.

Name	Dylan M. Fish, Disabled Autistic Student at RIT
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Autistic individuals often face challenges associated with co-occurring physical health conditions. Examples, such as gastrointestinal disorders, sleep disturbances, epilepsy, and sensory and motor challenges, contribute to a complex set of hurdles. These challenges can significantly impact daily life, comfort, and overall well-being, requiring tailored approaches in healthcare and support services.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The intersection of autism with mental health conditions like depression, anxiety, aggressive or self-injurious behavior, and suicidality adds a layer of complexity. Autistic individuals may encounter difficulties in expressing and managing their emotions, requiring nuanced mental health support that acknowledges and addresses their unique needs.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The co-occurrence of autism with learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities creates multifaceted challenges. Tailored educational strategies, inclusive communication approaches, and comprehensive developmental support are essential to address the diverse needs of this population.
What additional research is needed to help address co-occurring conditions for autistic people?	There is a crucial need for further research to understand the intricate interactions between autism and its co-occurring conditions. This includes investigating effective interventions, identifying risk factors, and developing targeted strategies for improved healthcare, education, and support services.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Enhancing autism services and supports necessitates a focus on equitable access, service system improvements, and positive patient-provider interactions. Addressing disparities in accessibility, insurance coverage, and eliminating barriers to services are vital steps toward ensuring comprehensive and inclusive support.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The COVID-19 pandemic has likely had lasting effects on co-occurring conditions for autistic individuals. Disruptions in services, increased remote work and school, and reduced in-person social interactions may have exacerbated challenges or, in some cases, provided new opportunities for support and adaptation.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Societal changes resulting from the pandemic have both positive and negative impacts on the physical and mental health of autistic individuals. Increased remote work and school might offer flexibility, but disruptions in services and reduced social interactions may pose challenges. Understanding these impacts is crucial for shaping post-pandemic support strategies.

Name	E.R
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Pathological DEMAND Avoidance struggles & managing as well as anxiety
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	ADHD
What additional research is needed to help address co-occurring conditions for autistic people?	Acknowledging and understanding more about pathological, demand, avoidance (PDA)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Consistency across-the-board with practitioners and diagnosis. As well as our support systems in the autistic community acknowledging this is on the autism spectrum and a subtype. With PDA we have had autistic therapists cause more damage, because they are ignoring that it even exists and needs very specific treatment plan
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Elena, Mother
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My 30 year old “child” has co-morbid conditions that overlap or are in addition to his autism. He has ADHD, which causes difficulty focusing and/or hyperfocussen, making him inconsistent when performing tasks. He’s sensitive to sudden loud noises, exacerbated by a past experience of being sat under a bell in a school, while it was being tested and suffering PTSD as a result. He also has a sensitivity to tags in clothing, which need removal before holes are torn. He also has mild OCD and gets obsessive about things in his surroundings. He also suffers from mild depression. Sleep has always been an issue: he cannot close his eyes to rest and will not sleep until exhausted. Due to his ADHD and OCD, he awakens often and runs through the living area to check on things before going back to bed. Gastrointestinal issues include Proctitis (in remission), and a years-long battle with IBS- which makes carrying a second pair of underwear a necessity. He is also lactose intolerant, and takes lactase enzymes before consuming dairy. He can and will eat everything. However, he has difficulty knowing when he is full. Twice in his life he has eaten until he vomited, but fortunately has a better handle on it as an “adult”. As an aside, he also has developmental issues, processing difficulties, and speech problems that make it difficult for him to make himself understood at times. All of the aforementioned mean that finding a job (and he is a hard worker) somewhat impossible.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	See aforementioned response, it includes most, if not all co-morbid conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	See response to first question. But, to clarify, all of his co-morbid conditions, which I consider to be common in people on the spectrum that I have met (and having a 30 year old son means I have met many- including a husband who has mild spectrum-like qualities), means that living and working situations are the most difficult things we face with our son. There needs to be a larger choice and variety of living options, and more education in the total employment field about how to integrate these wonderful and special people into the workforce.
What additional research is needed to help address co-occurring conditions for autistic people?	Research into better living and work options- which should include in-field research amongst employers in what they would find helpful to encourage them to hire people on the spectrum. Naturally, a revamping of employment education for those on the spectrum is important as well.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	For people that do not have a support system, such as my son (who has me and his father, as well as a wonderful community habilitation worker, Medicaid service coordinator, etc), insurance covered advocates that work for autistic individuals - not the school system, not the medical community, no one but the individual in question, would be a good place to begin. However, even those on the spectrum, such as my son, who has had me as his lifelong advocate, still need more assistance in order to have their living and working situations, not only improve, but be more ‘normalized’ as well. As for issues with members of the medical community- across the board- education on disability, including case studies in medical schools, etc. that

	include people on the spectrum as well as those with other disabling conditions needs to be made mandatory.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Change in routine can be more difficult for those on the spectrum. My son, who had previously volunteered at a Nursing Home for five years and traveled locally on his own (thanks to a great public school for special needs populations, as well as a great travel-training instructor), has not wanted to think about looking for another volunteer or work opportunity since Covid. He is still frightened of getting sick and of not finding something that will last. He has only just began going places on his own again (like to the local barber shop) these past two months. Now with rising infection rates in NY, he is growing worried again, as are we all, and is more hesitant to go out, even with a N95 mask on. We have all gotten the latest vaccine, but unfortunately, too many others have not.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My son used to have regular weekly in person social gatherings at his local YAI. However, Covid ended that. On-line social meetings have been a lifeline, as have been the few and far between in person gatherings - which I fear may dwindle again if infection rates continue upwards.

Name	Elenna
Demographic	Autistic individual; Family member of an autistic individual; Other
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Gastrointestinal distress is a very serious issue between both my brother and I. My younger brother has Celiac which is more common in autistic people and access to safe food in public services is a major issue for him. He also has a very restricted diet due to sensory issues. Food labeling and standard care is an issue as some foods labeled as "gluten free" are not celiac friendly and my brother's other difficulties are less manageable when he is in pain. Additionally, my own sensory issues are aggravated by my own menstrual cycle which makes it difficult to work, complete daily tasks, and take care of myself. I alleviate this by taking hormonal birth control at a low dose continuously, which helps, but birth control access is frequently at risk due to decisions by Federal and state lawmakers or my own access to insurance. This medication makes it possible for me to function without aid and is critical to my survival. Additionally motor challenges are an issue as they make driving difficult or impossible for some people - my younger brother cannot drive and paratransit is unreliable as is. Alternatives to driving are necessary to help autistic people participate in society.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Depression, anxiety, and suicidality have been extreme challenges in my life. During pandemic lockdown it wasn't that bad but once things cleared and people started returning to normal my anxiety was very high. When I had a recent suicidality episode I decided to seek psychiatric care and I was on a 6 month waiting list for a psychiatrist because so few were accepting new patients or even work with autistic or suicidal patients. When I last needed a therapist it took me almost 9 months to find someone remotely qualified who was accepting new patients and I had to attend therapy with two different therapists and call many more to find one who was qualified to treat me. Therapists and psychiatrists are not trained to work with autistic adults as a general rule. Grants towards therapists who want to learn to specialize or research autistic adults may help. Additionally after a layoff this year I became very depressed and anxious despite finding another job quickly. My new work situation is really not a good fit, which is aggravating my symptoms. My younger brother, meanwhile, requires assisted communication and did not receive it when he was younger. I believe if he had received more consistent access to AAC when he was younger rather than pushing for him to speak he would have stronger communication skills and be able to convey his needs, which would lessen aggressive and self-injurious behavior. (In the past, helping him to use them has helped.)</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>Communication is the single most significant thing that has followed me into adulthood. Learning and developmental disabilities get better with time and accommodation, but not being able to speak (in the case of my brother), and not being able to maintain relationships due to communication issues is a major issue for me and contributes to my depression, anxiety, and suicidality. The social skills class I received as a child did not help and in fact the people providing it were abusive to me and the other students, did not allow us to socialize with each other, and pathologized us for age-appropriate interests like Dragonball Z and Pokemon (we were 11-13). I've heard that other people have had different experiences since then - my main issue is that what I needed was a place to regularly socialize with my peers that was somewhat structured, I needed community with other autistic students who were in a similar ability range, and I needed adults that had appropriate training on how to help autistic teenagers. Unfortunately I did not have any of these</p>

	things and ended up finding them on the open internet, which is questionable.
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more research on the current status and needs of autistic adults of all support needs. Autism research primarily focuses on young children - there are few resources for autistic adults who have moderate or lower support needs and standard therapy and psychiatry often does not support us effectively. Research into the effectiveness of DBT and EDMR for autistic adults may help. Additionally research into the effectiveness of Occupational Therapy. Additionally, research into chronic pain disorders may be helpful. More diagnostic capabilities towards a non-speaking population who struggle to communicate in other ways could help improve quality of life for autistic adults. Surveying the availability of ingredient-restricted foods may be a good first step to address co-morbid food intolerances and celiac disease. Surveying the availability and efficacy of public transit and paratransit may be a good first step towards improving integration for those with co-occurring conditions that make driving difficult or unsafe. (I know that personally I would prefer to take public transit rather than drive but it is not available where I am.)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Providers often do not have training to work with autistic adults. Most training is geared towards young children. This is slowly starting to change but providing incentives for providers to pursue additional training to qualify themselves to work with autistic adults could help. Insurance is extremely important - however, insurance companies are incentivized to fight against covering care (mine randomly dropped the only therapist who is qualified to treat autistic adults that I have found). Publicly-funded health services are necessary to improve the quality of care for any chronic or permanent condition. That or insurance companies need strong penalties for refusing to cover care arbitrarily. Public transit and more effective paratransit is an accessibility need for autistic individuals like my brother who cannot drive at all. It is not appropriate for my brother to be in-transit for 4 hours on a trip that would take 30 minutes by a standard bus, but that has happened repeatedly.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 taught me that my quality of life is mostly better when I am able to perform most tasks remotely. Being able to access telehealth made it easier for me to receive medical care because I was not restricted to doctors within a commutable distance. I was also able to access a doctor for basic care when I would otherwise feel too sick to take myself to the office which is about 40 minutes away.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think that increased remote work, school, and telehealth improved my quality of life drastically. I do not feel much need to go out and do very public events and usually can not handle them anyway. Shifting back to in-person was a much more negative impact on my quality of life because insurance is now fighting me on my doctor's appointments and I am struggling to find work in my field in my area, so shifting away from remote-work really impacted my ability to find a job. My brother, on the other hand, is already limited in how he can get out of the house so removing his in-person services really impacted his quality of life negatively during the pandemic.

Name	Elio McCabe, Autistic Women & Nonbinary Network
Demographic	Autistic individual; Representative of advocacy organization
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Weight discrimination has made multiple headlines this year thanks to the AAP’s decision to encourage intentional weight loss for young children. For autistic people who experience multiple forms of discrimination and are more likely to experience abuse and violence, a punitive attitude toward food and nutrition adds insult to injury. The practices used to get larger people to lose weight are counterproductive and demeaning. There is an increasingly large body of research suggesting weight discrimination itself explains some of the adverse health outcomes associated with high weight. This is a form of allostatic load. We recommend that researchers conduct more participatory action research about autistic people, weight discrimination, racism, and other factors that lead to detrimental health outcomes. It is time for researchers and practitioners to rethink their vocabulary for larger people. We encourage autism/IDD researchers to lead the charge in changing the way we talk about weight and health. The first step is to end the use of the word “obesity.” For people with IDD, this term is analogous to terms like “idiot,” “moron,” or “imbecile.” It is rejected by the people it describes, especially Black people—just as the word “[redacted]” was rejected by people with intellectual disabilities. Listening to disabled people, or people thought to have health problems because of their weight, means using vocabulary that affirms their humanity. Anything else is epistemic injustice.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Nine out of ten autistic women have experienced sexual assault or harassment—and most of them experienced their first sexual abuse before the age of 15. ABA may increase this vulnerability. ABA, especially in its traditional form, teaches children to comply with parents’ and teachers’ demands using operant conditioning. ABA is especially dangerous when used in the hands of adults who take advantage of autistic children’s compliance training to sexually abuse them. Research needs to be conducted about autistic people’s response to sexual trauma and its possible relationship to compliance training. Studies exploring child abuse and autism should note that primary caregivers can and do sexually abuse their children. There is a known link between neurodiversity and gender diversity. People diagnosed with gender dysphoria are eleven times more likely to also be diagnosed with ASD. Numerous studies show that LGBTQ autistic people experience greater barriers to healthcare access than their allistic cisgender peers. This means that even when healthcare is available, autistic gender-diverse people’s experiences drive them away from it. More research is needed into improving barriers to care for gender diverse autistic people. IACC needs to take a public stand against the incredibly harmful myth of rapid onset gender dysphoria. Finally, research which takes into account the voices of autistic people should examine the link between gender dysphoria and autism.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>We encourage researchers studying autistic people’s health outcomes to consider the intersection between autism and other forms of marginalization, oppression and maltreatment. Autism researchers should listen to the experiences of autistic people. Far too often, the voices of</p>

	<p>parents and nonautistic people are treated as more important, more relevant than those of autistic people themselves. In her book of the same name, the philosopher Miranda Fricker introduces the concept of “epistemic injustice,” or the idea that marginalized people are unable to know their experiences because they occupy a low status on the social ladder. Although she focuses primarily on misogyny and racism, this principle can be applied to autistic people, too, as well as disabled people generally. Research that serves the autistic community should emphasize quality of life for autistic people, rather than the convenience of parents or practitioners. Co-occurring psychosocial disabilities and autism. Although some research on autism and co-occurring mental health conditions (e.g., PTSD, bipolar, generalized anxiety) exists, it is relatively scanty. Since autistic people experience stress and trauma in a world that was not adapted for our needs, it is likely that autistic people are more likely to develop psychosocial disabilities in response.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>There is a serious access need for autism screening in racially and socio-economically diverse settings. Although the prevalence of autism does not differ across racial or socioeconomic boundaries, diagnosis has consistently occurred earlier and at higher rates among white male children from higher socioeconomic backgrounds. It is only against the backdrop of COVID-19 that the Autism and Developmental Disabilities Monitoring Network saw its first year in which children from minority backgrounds were diagnosed with ASD at a higher rate than their white peers. Even then, male-identified children were still four times as likely to receive an ASD diagnosis as female-identified children. This is not an accurate representation of autism diagnoses. Female-identified children are often misdiagnosed, or not diagnosed until much later in life, missing out on early intervention and critical support. Estimates of the “true” number of female-identified people with ASD diagnoses vary, with one recent study suggesting as many as 80% of autistic women are not being diagnosed until adulthood. More research is needed into the current diagnostic systems in place that are creating this racial, socioeconomic, and gender divide. It should not take a mass disruption on the scale of COVID-19 for children of color to receive autism diagnoses at a rate equivalent to their peers. We must not wait for something even greater to address the gender divide.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? Name	Eliot C., Disability Network Washtenaw Monroe Livingston
Demographic	Autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I believe more research should be done on the co-occurrence of joint hypermobility disorders (like Ehlers-Danlos Syndrome) and autism. Many autistics experience lack of coordination or underdeveloped muscle tone, which affects the way we move. Additionally, we often desire physical pressure like hugging ourselves or stretching our bodies in atypical ways to regulate anxiety. Bringing one's legs into one's chest or other ways of over-extending our muscles might lead to greater physical joint pain down the road. Ehlers-Danlos Syndrome often features gastrointestinal issues, which may contribute to its greater prevalence among autistics.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Non-autistic people underestimate how much of our emotional disturbances are triggered by overstimulating, unsafe, or otherwise uncomfortable environments. Meltdowns or shutdowns often seem to come from nowhere from the outsider's perspective, but often they are the result of failing to keep ignoring the things that bother us that others don't seem to mind (bright lights and colors, intense smells, crowds of people, noisy environments, etc.). Mental health "treatments" for autism still focus on diminishing the behaviors that non-autistic people find disruptive or weird without regarding what is happening psychologically that causes us to produce those behaviors. Autistic people may end up traumatized from therapies that force them to hide their true feelings to appease authority figures. Even if we don't end up in ABA, we absorb social messaging that similarly suggests conforming to others' standards is the only way to be taken seriously in life. We need more research into trauma-informed treatments for mental illness among autistics, and into what mental health professionals need to know to be more responsive to autistic clients.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	How autistic sensory experiences contribute to mental illnesses like depression and anxiety Outcomes of autism-affirming mental health care Substance abuse treatments that are most effective for autistic clients In other words, anything that involves talking to and listening to autistic people (whether we communicate verbally, with AAC, in written language, or trusting that when we show emotional distress, there is a reason behind it)!
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Person-centered planning Coordination of Community Mental Health services (Michigan claims to have universal mental health care through CMH, but the same treatments are not available in every area) Provider education on autism acceptance and neurodiversity Insurance that covers autism services beyond ABA
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to	Telehealth and telework has been a positive outcome of the pandemic for me as an autistic adult. My psychiatrist's office had electronics that emitted a

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

high pitched frequency that interrupted my concentration. Now, I can attend my appointments in a comfortable, familiar environment, and our sessions have become more productive.

What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	<p>The Medicaid Home and Community-Based Services (HCBS) program is integral in improving the lives of people with autism. The HCBS program furthers the independence and empowerment of people with autism in their homes and in the community by offering person-centered habilitation supports designed to assist in acquiring, retaining, and improving the adaptive skills necessary to support community inclusion and integration. Yet, waitlists for HCBS programs for people with I/DD can be years long. Underinvestment and inadequate reimbursement rates have left providers unable to offer competitive wages, which has led to high turnover and vacancy rates. As a result, providers report higher rates of program closures and an inability to take on new referrals. The workforce shortage causes tangible negative effects for people with complex and co-occurring disabilities. A lack of consistency among staff severs bonds that have been created over time and leaves individuals without a person who is familiar to their unique needs. Without stable support in the community, individuals are at higher risk of hospitalization and institutionalization. The IACC must support policies to address the direct support workforce crisis, including increased investment in HCBS and guidance to states to support reviewing reimbursement rates. Strengthening access to person-centered supports furthers the IACC’s commitment to supporting services to maximize the quality of life for individuals with autism.</p>
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Elizabeth Bennett, Children's Hospital Colorado
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I think sleep has the most immediate and profound impact on families. It's hard to ask them to work on anything else when everyone's sleep is disrupted.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety. I think anxiety underlies many of the other hard things and certainly requires a great deal of management from families and results in avoidance of important things like vaccines and routine lab work.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The combination of ASD & ID is an especially difficult one that results in fewer choices for autistic people when they reach adulthood and increases the need for lifelong family supports.
What additional research is needed to help address co-occurring conditions for autistic people?	More work is needed to best understand how to reduce anxiety in autistic people. More work is needed on how to treat trauma in autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Colorado services are a mess with all the changes to CCBs. Getting services requires parents to have time and skills and access which are things not distributed equitably across all families. Kids with parents who are good case managers appear to have better outcomes than kids whose parents don't have the means to manage their child's team, for whatever reason. Rural areas have terrible access and few choices for many of the services we recommend. The inability to provide telehealth across state lines is an enormous barrier in the West where services are spread out and providers are few.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Elizabeth Doolittle
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances as younger child Has Rectal Prolapse as a consequence of trying to force his stool out which then became a behavioral issue he could not stop doing Skin sores from picking at skin or picking at wounds which makes them bigger and take longer to heal
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD - severe inattention to anything that is not a topic of interest, gets lost in his own thoughts TICS - has motor and vocal tics Irritability - can be extreme when things are not going as planned or he gets interrupted doing something he is engaged in
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Has co-occurring dyslexia and dysgraphia (although the dyslexia has been mostly remediated with intervention)
What additional research is needed to help address co-occurring conditions for autistic people?	More awareness of how this presents with type 1 autism - kids are not getting diagnosed and most people do not understand masking and how skills are present one day and not the other or how it depends on the situation. Kids that are high IQ are judged for not trying or as behavior problems and not kids with disabilities. My son's rigidity gets in the way of the help we try to give him. He is resistant to any help and does not see his behavior as a problem to the extent that it is. We struggle with school issues related to his inattention and there are interventions that could help him but he will not accept them. I would like to see research around working with our kids with Autism and learning disabilities (yet high IQ).
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	patient-provider interactions, teacher-student interactions
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It seems like after COVID my son withdrew socially more. He was not super social before COVID but he lost his confidence after not getting as much exposure to friends from school - birthday parties etc during this time.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	reduced in person social interactions and obligations

in-person social interactions and obligations)

Name	Elizabeth Emen, Emen Counseling Services
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	More research/validation in the US mental health system is needed for the PDA profile of Autism. This is an underlying nervous system difference that is not embraced or known for many of the individuals seeking psychiatric services and dealing with persistent mental health conditions. When Autism is unrecognized, which is due to many societal factors such as stereotypes about autism, limited diagnostic criteria that focus on deficits and miss other differences, and the reality of high masking and low social support needs, harm is done. To answer this question accurately, there needs to be a focus on accurate training and evaluation of autism that is non pathologizing. The PDA profile of Autism is at the root of complex persistent individual mental health and substance use disorder problems as well as systemic challenges, as unidentified autistic individuals who are high masking often have not been identified as having a disabled nervous system, and instead are viewed through a neurotypical lens so that when they experience social stressors or stressors to their nervous system they are pathologized in the behaviors that result. Most people are not aware that biological experiences that differ from what we are typically taught to expect, (sleep, eating, stress response) impact behavior and that these behavior differences can be indicators of autistic neurotype traits that mean other physiological differences in how the individual exists in the world.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Systems of care need to catch up to better understand the overlap and connections between ADHD and Autism. The evaluation and treatment of anxiety has different origins and treatment needs depending on whether there are underlying ADHD and Autism traits. Nervous system biology is not at the center of mental health diagnostic systems and treatment services and this is an enormous disservice to the autistic community and others. The assessment and interventions through a nervous system and neurotype lens yield drastically different results for an autistic individual than if they are assessed and viewed through the traditional behavioral health model- this is a form of ongoing oppression and harm to all, specifically the unidentified community of autistic individuals that are socially high masking/low support needs and often do not even know that they themselves are autistic. They many diagnoses they've often been given are typically inadequate external assessments about the symptoms that have resulted from not being accommodated and supported with their biological differences, and do not account for internal experiences and true differences in biological needs.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	In the case of PDA Autism, when nervous system activation occurs in response to perceived demands or losses of autonomy, stress accumulates and has the individual constantly in survival mode, when not being accommodated they are rarely using logic and frontal lobe processing to communicate and lots of blaming and misunderstanding result from the nervous system reactions that others observe and judge in the context of viewing them as NT individuals. This behavior is often misjudged as disabilities in learning, intellect and communication when in fact nervous system activation and flooding are at the root. The deficit model contributes to this inaccuracy and misunderstanding by teaching providers to look for limits to communication instead of differences. Learning disabilities are characterized based on assumption of underlying abilities- and the impact of being in a demand that is activating stress due to unique threat perception- is not accounted for in evaluation. In the presence of seemingly typical verbal

	communication, assumptions that the individual is sensing and perceiving the same as their peers is wrongly made.
What additional research is needed to help address co-occurring conditions for autistic people?	Research and data that conveys the reality that autistic traits present in a variety of ways, that shine a line on true neurodivergence and move common understanding beyond the limited historical viewpoints that expected to see verbal and social deficits, or high intellectual functioning but low social motivation. Research that supports the idea that social motivation and the desire to connect socially cannot be adequately measured through neurotypical standards and when individuals are not accommodated or supported to develop positive self-identity. All individuals need and are motivated by human connection, inadequate understanding of autism leads to stereotypes that autistic people are not social humans and deficient in skills. What people have been conditioned to understand and look for as autism both in professional and layperson circles is a barrier to truly understanding autistic neurotypes and the co-occurring differences, experiences and symptoms that result from being different and misunderstood in the world not designed for them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Focus research and understanding that informs services and supports on the lens of the nervous system rather than behavioral and compliance based models of functioning. Services and supports need to emphasize the importance of internal experience over external signs of neurotype differences. Prioritize putting PDA, Pathological Demand Avoidance/Persistent Drive for Autonomy in the DSM or find an alternative way to standardize the awareness and inclusion of PDAers and other high masking autistics in all communities of life.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The pandemic resulted in a collective prolonged anxiety that had impacts on every systemic level of daily life for US individuals. The access to social and economic resources was a potential mediator for the individual/family experience of stress. For those highly impacted by stress prior to the pandemic, the pandemic contributed to the accumulation of dysregulation and lessened capacity for many that may not have manifested as quickly or in the same way without the global experiences related to COVID-19. For all individuals, cumulative anxiety and prolonged dysregulation has significant impacts on physical and mental health experiences. For autistic individuals, this experience from the pandemic was superimposed on other layers of prolonged anxiety and distress that were already present related to neurotype and environmental interactions.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The accumulation of stress leading to chronic dysregulation often leads to a greater need for reliability, predictability and management of changing social and environmental experiences- this is theorized as a significant underlying experience in the perceives social and cognitive differences of the autistic individual. While there were opportunities for Autistic individuals to be more accommodated in their differences, such as with flexible telework schedules and use of technology to communicate, there were also sweeping changes in the way day to day life was managed and ambiguity in these experiences that increased unpredictability and forced change for folks before they may have had ample time to process or adapt. More research is needed to explore the nuances of these experiences of accommodation and adapting to changes and how they impacted Autistic individuals overall.

Name	Elizabeth Larned, MA, LMHC-A
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	ehlers danlos syndrome, a connective tissue disorder commonly co-occurring with Autism. It's underdiagnosed, and is usually written off as laziness in adults, or an unwillingness to try physical activities in children. They're not lazy, they're undersupported.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The anxiety that comes from thinking they should "just have it right by now"
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Perhaps the most challenging is the lack of opportunity to learn social skills. Autistic people are often raised by autistic people, the only chance at "normal" socialization is through school and community. While some communities know how to support people with autism, most write it off as character deficits. This can cause issues at school, in the work place, and with loved ones.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on the actual number of people with hEDS (hyper-mobile Ehlers Danlos syndrome) versus the previously estimated numbers. It's a connective tissue disorder, as mentioned above, which is highly correlated with eating and feeding complications, speech, heart health, all the joints. It's sorely under-researched and most physical therapists aren't trained to recognize it well.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	advocates in medical spaces would be a big deal, it's difficult for folx with autism to relay their experiences in a way that most medical professionals are receptive to, as they can be seen as "argumentative". Remaining employed is the biggest challenge for adults with autism. I'm a mental health professional so I can't speak to how to address that, exactly, but lack of income is really crushing for someone who can't work due to their disabilities.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Anxiety, weakened immune systems, social phobia. Depression, anxiety, lack of confidence.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	More remote services and work options is helpful for a lot of folx with autism. Disruption in services is dependent on the state, as many states don't have sufficient or clear resources for autistic individuals.

Name	Elizabeth Olson
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	It's very difficult to operate in society when you have co-occurring health conditions with autism. The health conditions are often not taken seriously by doctors or by society at large making it difficult to get accommodations, diagnosis and support. It's also very expensive and difficult to get medical care in this country.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Very difficult to work and to maintain a job with autism and mental health problems. Working tends to make the mental health problems worse by overstimulation and ableism at work. Work also takes all of the energy we have and we don't have any energy left for things we enjoy so that also adds to mental health deteriorating. It's difficult to get accommodations at work for mental health struggles, and once we tell our employees we are autistic we are often subjected to abuse.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities make communication ever harder, communicating is hard enough already but add not being able to form sentences to it and trying to communicate with bosses or coworkers becomes difficult and at times dangerous.
What additional research is needed to help address co-occurring conditions for autistic people?	More research on why we have different bodies compared to neurotypicals. It's hard to get a diagnosis as an autistic person because doctors often can't figure out what's wrong with us. more research on how jobs can be more accommodating to autistic people, and designing buildings to be sensory friendly (minimizing echoes, natural lighting)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	There needs to be a way for autistic people to get more help financially, almost like a universal income. Working while being autistic is extremely difficult and there needs to be a way where we can work half time and then receive a supplemental income, or an entire supplemental income . I've been denied for disability income twice, and I would only receive \$800 a month if I got approved. That is not enough to live off of. Disability income is designed to keep disabled people in poverty, and there needs to be a reform where it's easier for people to get help and receive enough money to live off of.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Working from home has been an improvement for a lot of autistic people.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased remote work has helped a lot of autistic people. I think things being more accessible online has helped a lot of us as well.

Name	Ellen
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep, sensory problems, auditory problems
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, adhd, disregulation
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication & learning
What additional research is needed to help address co-occurring conditions for autistic people?	1. Do traits increase or decrease with age? 2. Do traits increase or decrease based on level of support needs? 3. What are college & job statistics? 4. Housing? 5. What is the likelihood of co occurring?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	1. Services for all ages & levels of support 2. More support for caregivers 3. More healthcare providers with knowledge about autism & co occurring
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	1. Stuck inside more 2. Change of routine 3. Not able to see normal help or support
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increase remote work Masks Reduced in-person interactions More empathy

Name	Ellen Kopel-Puretz
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	EPILEPSY!
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PTSD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	link between epilepsy and autism - perhaps it can lead in the right direction for a cure for epilepsy the effects of ABA - and resulting PTSD
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	get quantified data to encourage universities to properly educate teachers, therapists, and other medical professionals on HELPFUL accommodations and supports
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Elyssa Bolt
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	People in the autism community report a higher incidence of gastrointestinal problems than the general population. Autism correlates with delayed development in gross motor skills, which most of us outgrow eventually but not before sustaining negative childhood experiences of physical education and participation in sports. As a result of these frustrations, autistic people are likely to avoid exercise and physically demanding recreation, which makes the consequences of insufficient exercise not an inherent symptom of autism but another dimension of how many of us experience alienation from important areas of life.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many autistic adults with a co-occurring bipolar diagnosis argue that this link needs to be better understood by educators, parents, and eventually employers. Being constantly in trouble for time management and mood dysregulation throughout childhood and well into adulthood takes a considerable toll on most bipolar individuals' mental health, an impact that is felt especially hard by people who also struggle with the sensory and social struggles associated with autism. The distinct yet probably related condition of borderline personality disorder, or BPD, is thought by some experts to ultimately be a self-preserving response to adverse childhood experiences, which autistic individuals are more likely to experience. Another mental health condition often experienced by autistic people is post-traumatic stress disorder, or PTSD. The same question of whether one causes the other or some other factor causes both applies to the link between autism and PTSD, but in any event autistic people are more likely than the general population to report PTSD symptoms and diagnoses. Among the autism community, the general consensus is that we are more likely to experience traumatic events than allistic people due to sensory overloads and trouble reading social situations that are prevalent autistic traits.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	As one of the major symptoms of autism is difficulty with sensory processing, many autistic adults – especially if undiagnosed – develop substance use disorder because alcohol and drug use can dull the sensory distress that many of us feel in environments that allistic people would find comfortable or neutral. Engaging in substance use can also break down social barriers that autistic individuals feel constricted by; not only does drinking help us fit in more with neurotypical peers, it also allows more flexibility of behavior that means that visibly autistic traits are often more tolerated in an alcohol-infused environment than in other situations. Statistics vary on the exact percentage of autistic adults who are unemployed at any given time, but some estimates put it as high as 85%. The expectation in much of the modern work world that employees simply continue to generate some unit of productivity at a continuous, linear rate does not mesh well with the abilities of many autistic people, especially with the co-occurring mental health conditions identified earlier. Job interviews are stressful for most people, but more so for people with visible struggles in displaying expected behaviors such as eye contact. Many autistic people, though by no means all, are naturally inclined to either answer questions very briefly or at great length, both of which are detrimental to success in job interviews and in situations regularly encountered in many jobs.
What additional research is needed to help address co-occurring conditions for autistic people?	Research needs relating to autism include, but are not limited to, appropriate pedagogical methods, the phenomenon of masking autistic traits, giving priority to autistic voices when we speak about ourselves, the exact nature of

	the bipolar-borderline-autism dynamic, factors that differentiate success from struggle within the autistic population, the impact of media portrayals of autism, the different expression of autistic traits in different genders, and the impact of aging on autistic traits.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Service needs sometimes overlap with research needs. I identify four areas of need for increased services: first, the abolition of Applied Behavioral Analysis (ABA) practices that are often wrongly perceived as therapy; second, the establishment of appropriate supports in school settings; third, greater visibility in all areas of life of diverse experiences of autism; fourth, funding for social support groups for a greater range of ages.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Emilee
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues, sleep disturbances, but usually society in general causes the most issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	All of the above. Mostly depression, which can be caused by a lot of comorbidities
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Stereotypical work/school week.
What additional research is needed to help address co-occurring conditions for autistic people?	Have people with autism conduct the research and come up with the study questions.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Humans instead of automated services, better public transportation
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It has shown that too many people do not care about their community and people with illnesses, and only care about themselves. This makes me fear being around others more than I did previously
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive: more remote options

Name	emily
Demographic	Autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Much of my physical distress is disabling due to treatments administered under the assumption of inaccurate diagnoses. Key realms of distress: GI - unbearable esophageal spasms. Mobility - impaired by normalized abuse. Obesity - unable to thrive nutritionally or with regards to physical fitness after misguided pharmaceutical treatments. A way that all of these issues are made further distressing, however, is the emotional impact of my awareness of rejection from others around me. This becomes a prominent issue in my physical reality because of rejection I faced from a thin mother as a fat child. It may seem silly, but because the rejection has been felt by my body physically, it manifests in disease. I'm not exaggerating when I say acceptance changes the experience of my physical symptoms. The threat that rejection from others poses to my body and its ability to survive has kept me indoors. I am in very poor health from the isolation. These confluxes of emotional and physical symptoms also present a risk to me when it comes to seeking any medical guidance. The emotional reality of medical gaslighting is not something my body can survive. I hope this makes sense. I'm not claiming that autists experience a different mind-body connection than allistics, rather, that connection is more sensitive, and therefore plays a role in autism as a disability.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>I would say the hardest part of having any issue while being autistic is that the people whose job it is to help you truly believe that you can't possibly mean the things you're saying to them directly. There have been times in my life I was given harmful treatment because doctors and adults believed that my self-reporting and observable behavior were closer to manipulation than a genuine prompt for a child's needs to be met. In my generation, lots of people embodied a haunting image to adults - cutting our wrists, choosing drugs over consciousness, and so many children we lost to opiates. The ways we were treated for the methods we found to soothe ourselves and survive our environments were damaging in all the the ways that adults can carry damage from childhood experiences. I think to help us, the goal shouldn't be to have a kid who doesn't hurt themselves. It's to take it seriously when they let you know why it is they're hurting themselves. I honestly can't understand what adults thought we were doing - trying to be cool? Our pain was being dismissed as misbehavior - it was a disaster. The gaslighting is a physical threat as it is to any trauma survivor. I know you need to address pressing and tangible issues, but I also know I'm not alone when I say that I told the adults the first time. I told the adults directly. I used my words. And they just... thought I meant something that I didn't mean. And I never got a chance in this world, because of it.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>I can answer regarding learning disabilities and communication disabilities. Regarding learning disabilities, the way that autism has affected me deals with communicating the ways that I learn. People are often confused and don't allow me the time to explain in full that what I require in order to learn how to do something is to see someone do it, try doing it myself, ask questions, usually get some help from someone who knows how to do it, and then after that I can pretty much always do that thing - or, at least, to the extent that my body is able to that day. The knowledge of how to do the thing is permanently learned, though. I am so often excluded, though, when it seems to others that my sentences have too many words in them, or that my thoughts have too many sentences. It is very painful to be dismissed and assume ineligible in this way. It is so painful that it has impacted my</p>

	<p>central nervous system greatly, and I have been unable to seek medical care because of the recursive issue regarding the lack of patience in the medical industry for well-informed patients. And so this is really more of a communication issue, and this is not a disability for me; it is a shortcoming among allistics. I am a very effective and talented communicator. Allistics become angry and confused when my sentences are long or challenge perceived societal hierarchies. I am a very invested and skilled communicator. I have been disabled by the inability of others to hear me.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>More professionals need to be trauma-informed and stay up to date on best practices for complex trauma - in fact, all medical professionals should be required to keep their education on this topic active and ongoing. The amount of harm that is coming directly from the medical industry to autists - for whom chronic illnesses are statistically more likely - is demonstrative that a broken system can be repaired by accommodating the most vulnerable members of a community. I believe that by giving (needs-based) spaces to autistic people to explain in more depth what our experience is like, the whole of society can improve our infrastructure to produce better outcomes from infancy - both psychological and physical. Our species is in a crisis of empathy, and to draw the line at doctors hurting patients and facing no consequences for permanent nervous system damage would be a world-saving move, on a historical/ideological scale. Be kind. Listen. Believe. Respect. Care. This is research that takes place in the heart, and in the determination to see a better world, which I know we all do.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Like I've said, a lot of the obstacles come down to autistic styles of communication being dismissed, disrespected, invalidated, and pathologized. While I could write out extensive suggestions for improvements to every system we interact with, this text field only allows 1500 characters. ([profanity redacted] decent of you to let us navigate between answers, though.) And so again I believe this comes down to a matter of acceptance. We need for skilled allistics to become more willing to translate what we are saying, and that requires acceptance that we are who we say we are and we mean what we say we mean. If a broadly applicable protocol can be adopted by allistics (trauma-informed practice in all fields) then autistics will be more able to communicate. When we can communicate accurately about our sensitivities, those sensitivities can illuminate needs that extend beyond our community. It is the acceptance of the systems as they exist, to the detriment of autistic loved ones, that prevents allistics from being able to hear us when we talk.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I will keep this one simple: I have a worse case of long covid than anyone i know. I can feel myself dying. And after screaming for help from my community for years now, stating my needs directly and deteriorating in front of their very eyes, I know what the idea behind chewing one's own tongue off is.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>This one i'll also put quite frankly, sirs and madams, and I think you'll catch my drift here: if y'all let us die out like it has seemed might happen, you could be making things worse for yourselves in the long run - I don't think any of you understand that an alternative to dystopia can exist, let alone map out the moving parts necessary for change for sixteen hour stretches at a time. But we both knew that, didn't we?</p>

Name	Emily
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have IBS and i recently had two polyps removed in a colonoscopy that were precancerous. I have a hiatal hernia that was discovered in an endoscopy. I have irregular sleep patterns, and I experience sleep paralysis and night terrors. I've dealt with depression and anxiety for as long as I can remember and have autistic meltdowns frequently do to exhaustion. I have sensory sensitivity to lights, sounds and texture and have a hard time focusing and executing tasks because of it and it makes it difficult to communicate my discomfort.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I've dealt with depression and anxiety all my life, but it wasn't until I was 16 when I noticed I've become more aggressive, almost like how it is with Borderline Personality Disorder. I've always experienced ADHD symptoms, but never was treated for it because I was diagnosed with autism at the age of 3 and that was the primary focus of my care. I've never self harmed but I've definitely felt suicidal at times when I'm burnt out and spiral into a depressive state, usually around my menstrual cycle.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I was never diagnosed with hyper mobility/Ehlers Danlos Syndrome but I suspect I have it, which might have caused me to develop a hiatal hernia. It also affects my digestive system. I also get dizzy spells and have migraines from dehydration and have to over compensate with my sodium intake.
What additional research is needed to help address co-occurring conditions for autistic people?	Shift your focus away from young, white boys and focus on women, people of color and different age groups as we experience the world differently and have to adjust to social norms that white men don't experience.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easier accessibility to insurance, not just Medicare/Medicaid. Improve ethics in healthcare.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Regression in mental development, brain fog.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	It has all been negative. My work load has increased but my pay has not, and I am burnt out constantly and have had to go to therapy because of it.

Name	Emily
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	gastrointestinal distress, sleeping too much or too little, vivid dreams, lights being too loud especially in public places, lighting in general being wrong in most places, makes it difficult to focus on anything else.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, depression, anxiety, low self-esteem
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Autism and ADHD have made reading difficult. Dyslexia and dyscalculia are common. Then frustration with not knowing how to communicate what the issues are.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easier online options for communication and access to services. I don't want to talk to people. I will avoid many things if it means I have to speak to a person. Texting options would be helpful.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation was not stressful. However, coming back after isolation, I realized my 'autism mask' has come off. I didn't have to 'act like a normal person' for so long I sort of forgot how to. Ive finally allowed my natural self out and as a result my anxiety has decreased. The options for being able to do more things online has helped as well.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth and work from home have been the best things ever. Delivery services are great as well. I don't need constant human interaction to survive like neurotypicals do. I prefer isolation and am better mentally because of it.

Name	Emily Garris
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has autism and multiple co-occurring health conditions. He has sleep disturbances, sensory issues, and mental health issues. These make it difficult or impossible for him to have a job, maintain his hygiene, have relationships with others, attend school, drive, and live independently.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son has multiple mental health diagnoses that co-exist with autism. He has schizoaffective disorder, depression, and anxiety. It is difficult or impossible for him to understand the point of view of another person, he can be paranoid, he gets overly anxious about minor health concerns, he has had several hospitalizations for suicidal ideations, he handles transitions poorly, he has demand avoidance, he freezes under any kind of pressure, he is socially anxious, he sometimes sees and hears things that aren't really there. All of these things affect his ability to live independently and have a fulfilling life.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	I'd love to see more research into the concept of demand avoidance. Where the brain and nervous system sees all sensory input as a demand and therefore the brain is constantly in a state of fight/flight/fawn/freeze. Also it would be great if some of the "branches" or "offshoot" phenotypes of autism could be classified as disabilities and have actual medical diagnoses.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The covid pandemic and shutdown was the catalyst that led to us seeking an autism evaluation for our son. The sudden shutdown of school, classes via zoom, the fear of catching and dying from covid, isolation from friends and extended family really caused his mental health and autistic behaviors to worsen and his quality of life hasn't recovered.

Name	Emily Paige Ballou
Demographic	Autistic individual; Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	While I'd consider sensory and motor challenges intrinsic to autism and not "co-occurring," inertia and auditory hypersensitivity/auditory processing challenges are the most significant physical challenges related to autism I face. Of conditions I would consider truly "co-occurring," personally, I would say gastrointestinal pain, sleep disturbances, and for most of my life although not currently, painful menstrual periods.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Personally, the most pervasive challenge is anxiety, related to any number of challenges and uncertainties that affect me as an autistic person far more than they do most people, and for which I have very little support available. I don't know whether I'd consider this more of a mental health condition or a social factor, but I'd also say loneliness. For autistic people in general, probably depression and suicidality.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research into autistic experiences of movement differences/motor challenges that might improve knowledge of both social communication difficulties associated with body language differences, and how best to serve autistic people in services like physical and occupational therapy, support those with complex communication needs, and better support autistic people in gaining the skills we need to live autonomously (meaning: not necessarily "independently," but best able to direct the course of our own lives). Research into the safest and best-tolerated treatments for anxiety, depression, as well as epilepsy and heart disease (which are common causes of early death in autistic and developmentally disabled people).
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Availability of one-on-one assistance navigating the healthcare and health insurance systems.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Personally, while the lasting impacts of Covid-19 infection itself on my physical health are yet to be clear, the experience of the pandemic in a multitude of other ways has left me suffering from heightened anxiety, isolation, and loneliness, as well as overwhelming circumstances at work (understaffing, erratic schedules, physical stress associated with mask-wearing requirements, poor physical working conditions).
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	To some extent, the increase in remote work has been a positive, which allows me to avoid sensory overloading public transit use more days of the week. There was a period of time, however, in which the increase in online compared to in-person work was incredibly stressful for the amount of screen time required, learning curve involved in learning virtual systems, etc. To some extent I've experienced a relief from financial pressures due to

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	enhanced unemployment benefits available during the pandemic. In both the short and long term, the pandemic has complicated my access to health insurance. Relaxed eligibility requirements, the 6-month federal COBRA subsidy, and short-term bridge plans made available by my union's health and pension fund helped keep me insured for the duration of the pandemic, but impacts on my career field and the finances of our health and pension plan have made our insurance more difficult both to qualify for and to keep.
---	--

Name	Emily Ransom
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Communication challenges with an individual with autism can make self reporting difficult.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	If communication is a barrier for an individual with autism it may make it harder to work with a mental health professional to address the co-occurring mental health conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication plays a big barrier for individuals with autism and/or other disabilities to seek the right treatment and/or medication from a professional because of the lack of communication or understanding.
What additional research is needed to help address co-occurring conditions for autistic people?	Additional research needs to be investigated on the individuals with autism who are nonverbal or lack of communication skills.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The improvement for individual's with severe autism and their families more resources to help with the challenges. Improving waitlist for therapies to help address the self injurious behaviors or challenging behaviors. Providing families with professional mental health therapists to help address their needs as well. Being an autism parent to a child with severe autism can take a toll on parents mental health. It's vital the support is there for the families as well as the child and/or individual.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Covid-19 has made a huge impact for families to seek early intervention care on their young child showing signs of "autism" because the world was shutdown for months. Waitlist became even longer. The child continues to struggle and intervention is put on the back burner because of the waitlist.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	One positive impact Covid-19 had on my son with autism and has his mother is working hard to get him to wear a mask. Imagine having a child that is nonverbal and intellectually disabled be forced to wear a mask or they won't see your child. The hours upon hours working with my son we were able to have my son wear the mask without displaying challenging behaviors.

Name	Emily, Autistic individual
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Depending on the meaning of the term “most significant”, whether it refers to “most serious” or “most prevalent”, I would conclude that epilepsy is the former, and sensory processing disorder, the latter. I do not have epilepsy, but I experience significant challenges accessing public spaces due to the severity of my sensory processing difficulties. The fluorescent lighting, overhead music, and bright white walls and floors that are most commonly observed in large department stores or grocery stores, are too much for my sensory system to integrate appropriately, and I am prevented from remaining in these spaces long enough to complete errands without getting overwhelmed, even when I have my support worker with me to help me manage my sensory responses.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self-injurious behaviors are one of the most serious symptoms of challenges related to emotional self-regulation, anxiety disorders, and depressive episodes. They can have physical medical consequences that reach beyond an immediate moment of dysregulation. Personally I have experienced at least three instances of ER admission and CAT scans due to acute head trauma caused by my own uncontrollable self-injury. Self-harm such as head banging, scratching, biting, hair pulling, etc. are common in those with developmental disabilities, because our brains lack the capacity to respond to socially, emotionally or physically challenging situations in a measured and rational way. The self-harm is not deliberate or calculated, it is an automatic, unmanageable response to distress that we do not have the skills to navigate in a cognitively appropriate way.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication difficulties are a common and serious concern for those with autism. An estimated one third of the autistic population is either nonverbal (no functional verbal speech) or minimally verbal (fewer than 30 words of functional verbal speech). As a level 2 autistic with moderate to high support needs, I rely on a speech generating device (alternative and augmentative communication, abbreviated AAC) for much of my interaction with others. Without it, I would struggle to get my needs met, my emotional experiences understood, and my ideas heard. A greater emphasis on supports specifically for autistic adults (as opposed to autistic children) who need more communication support, is, I believe, a high priority need.
What additional research is needed to help address co-occurring conditions for autistic people?	Really any research on autism and its comorbidities that focuses specifically on adults, especially women and individuals of minority ethnicities, is critically needed at this juncture. The vast majority of autism research is conducted on young children, and that which is conducted on adults, invariably includes primarily or exclusively white males as its experimental group participants.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for autistics, especially autistic adults, is critical. I depend on Medicaid and my state’s SLS waiver to cover every one of my autism-related supports and services, including my in-home caregiver who supports me with the tasks of daily life, and the day program I attend, which is my only source of non-professional social interaction outside of the family members with whom I live. So many autistic individuals who have lower support needs than me, who are able to work to the degree that they do not qualify for Medicaid, struggle to find supports and services that meet their needs at all, never mind services which their private health insurance will cover, and whose copays and deductibles they can afford. A greater emphasis on affordable health insurance, and on services to meet a wide severity spectrum of needs, is of paramount importance.

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Disruption of services was hugely impactful to myself and many other autistic individuals during the pandemic. Many of my services paused entirely, and others were not conducive to a telehealth format (for instance, occupational therapy). That said, the increase in the use of telehealth appointments has been very beneficial in the long run. It allows me to attend my appointments without having to overwhelm my sensory system on days when getting out of the house is too overwhelming. I have also heard other autistics who work more traditional office jobs say that they have benefitted greatly from their new ability to work from home.</p>

Name	Emma
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The lack of medical providers with awareness of autism when seeking care for related conditions (in my case, hypermobility, POTS and MCAS). Simply knowing that someone is autistic can tell you a lot about what their immediate and potential future health concerns might be, including important stuff like how we metabolize medications, and how difficult lifestyle changes are for us, but this is not taught in med school or in training for most specialties, and this is a factor in our life expectancies being so much shorter than allistics’.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Not being able to access treatment from providers who understand what it’s like to be autistic—I’m lucky to have found an autistic therapist and I’m never going back. Also, the most common treatment paradigms, such as CBT, have not been studied in autistic populations, which means that there is literally no evidence based psychotherapy available to us, and while many in the autistic community are aware that CBT isn’t effective for most autistics, and that we need different approaches to mindfulness techniques, the approaches that work better for us, such as DBT and existential therapies, are much harder to access—and still have the drawback of not being designed with our neurotype in mind. Another issue for autistics with co occurring mental health concerns is that for a lot of people, especially women and people of color, have their mental health problems diagnosed first and then autism is overlooked. Many of us end up on dangerously high doses of medications we don’t actually need and are doing more harm than good for years. I interacted with dozens of mental health providers over the course of almost 20 years, I worked with some of them for 5+ years, and none of them figured out I was autistic. How many people just like me will never get the help they need because the people they ask for help can’t recognize obvious autism? What could my life have been if I had known sooner?
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	More research needs to be done on autistic burnout, because it triggers a lot of co-occurring chronic illnesses, especially those involving autonomic dysfunction. How to recover from autistic burnout needs to be explored as well.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Make funding available for individuals for services that are considered luxury amenities, like grocery delivery, home repair, yard work, housekeeping, tax prep, a personal assistant, etc. There are tons of professional services already available that could make our lives so much easier, but most of us can’t afford them.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	Increased availability of virtual options for healthcare and employment is a good thing.

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Emmett Lockwood
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have Ehlers-Danlos Syndrome in addition to Autism. Ehlers-Danlos Syndrome is a connective tissue disorder, the most significant challenge cause by it is mitigating the ease with which my joints dislocate or go into subluxation. Because of this I have to walk with crutches, forgo different types of physical activity - eg running or weightlifting- that put excess strain on my joints. One thing is that because of Autism I have worse proprioception then other people with Ehlers-Danlos syndrome this means I get less of the feedback from my body about when I am about to dislocate or sublux a joint and often push by body harder than I should. I also have Celiac's disease which leads to a lot of gastrointestinal problems especially in settings when others are cooking for me and are as not careful with my dietary restrictions as I am.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have been diagnosed with PTSD, anxiety, depression, and ADHD. I have had my anxiety, and PTSD diagnoses since age 13, I got diagnosed with depression at age 17 and with ADHD at age 20. One of the major challenges I have had with my co-occurring mental health diagnoses other than the symptoms of the diagnoses themselves is how because of Autism my presentation of them is slightly different - for instance I have had to explain to mental health professionals that there is a felt difference between sensory overload and needing to not interact with people to preserve my own energy versus not feeling apathetic towards interacting with people because of depression. In addition during therapy I have found while I am really good at rationalizing and understanding why I am feeling that thing because of childhood messaging that I needed to have smaller emotions I am not good at actually letting myself feel my feelings without getting anxious about how I am masking my autism in front of others.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have Meares-Irlen Syndrome - and optic nerve disorder that affects depth perception, and my ability to read that I was diagnosed with at the age of 7. One of the main treatments for this disorder that allows me to read and gives me some frontal depth perception back is glasses, however unlike other glasses these glasses are dark -meant to block out the wavelength of light my optic nerve struggles with processing - and look a bit like sunglasses on first glance. While people can see some of my eyes through them one thing I struggle with is that when I am attempting to show emotion often people have a harder time reading me - harder than normal when I am masking my autism - because they can't read the emotion coming from my eyes.
What additional research is needed to help address co-occurring conditions for autistic people?	I think more research and training should go into the interaction between autism and specific co-occurring conditions. To be clear I would never wish to get rid of my autism or any of my other conditions, many of them I consider inherent parts of my and while some of them can be a pain in the [profanity redacted] I would not know who I am without them. What I would want to see though is not having to explain or work through with every one of my doctors how a condition affects me because of my autism, and while there is different experiences because Autism is a spectrum I would want more research into where these interactions are so it feels like less guess work.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services,	I didn't get my autism diagnosis till age 19 because I grew up with parents who due to the forced sterilization of my great grandmother and forced institutionalization of my great great grandmother were worried about how a diagnosis would mark my life and peoples views of my potential. What could be improved in supports is really any support for individuals diagnosed in

<p>insurance coverage, service systems issues, patient-provider interactions)</p>	<p>adulthood with Autism and the elimination of autism registers in states such as New Hampshire that scare parents out of seeking diagnosis and currently leave children without answers and without help. Insurance coverage for supports other than Applied Behavioral Analysis therapy - which has been shown to lead to increased rates of PTSD in autistic individuals who endure this therapy that seeks to make us neurotypical - is the bare minimum. Also equitable access to services to communities of color, individuals assigned female at birth, and impoverished communities. As a mixed white and indigenous trans man I have experience first hand how some providers still believe that white cisgender boys have autism this blocks access to diagnosis and access to services for many individuals.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I have not had a COVID-19 infection at this point - knock on wood- but as someone who was diagnosed with autism during the COVID-19 pandemic and as someone who has experienced healthcare systems both in the rural Vermont town I am from and in my college town is a small city in Wisconsin I can say the waitlists for seeing providers have ranges from months to years long (I have been on waitlists for an appointment for a specialist for Ehlers Danlos Syndrome for over a year and have been told I will probably have to wait a year and a half before I see the provider). Wait times aren't just annoying but often because there is the administrative burden of having to call providers every month to make sure my name is still on the waitlist (a requirement by many providers) it adds an administrative burden for autistic folks.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I have been lucky that it feels like my social circles have become far more well versed in online communication and online meet ups as a form of socializing - note most of my friends are also disabled and this has opened our worlds up in many ways. While it was nice to see increased accessibility at the start of the pandemic - finally it felt like my own variable ability to attend in person events was being accommodated through online options - I was worried like many people about when this accessibility would end. I did not experience this same flexibility in university or high school settings and it has now felt like people react negatively to being asked if there is a virtual or hybrid option offered. I also really enjoyed masks as it put less pressure on me to preform emotions with the lower half of my face but it has become hard as I now receive increased questions about why I am still masking - despite having individuals in my close friends who are immunocompromised.</p>

Name	Erin , Parent/guardian
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has never slept through the night. He is 24 years old. He has OCD in addition to many other manifestations of autism and OCD. He can't be left alone due to his OCD- accessing food, technology, a want to leave the house.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There is no help for the 24/7 care our loved ones need in so many aspects
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	the most significant challenges are the lack of help and services, especially once individuals age out of the school district in the state of Washington. There are no services available
What additional research is needed to help address co-occurring conditions for autistic people?	Profound autism needs to be acknowledged. Not everyone has exceptional skills that make them a wizard with technology numbers. Individuals with profound autism, often have self injury, OCD, anxiety that keep them from being able to access the world, keeps them at home, keeps caregivers in a constant state of emergency. My own son ended up stuck in the hospital for 47 days a year ago with no support or services and no way to safely. Bring him home. It's a crime to not acknowledge This group of individuals who desperately needs services isn't support as well as their caregivers
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	There are no current services or access for any actual care for our loved ones with profound autism. Once they fall off the service cliff which is finishing the school district programming, they're left with nothing but to sit at home. Caregivers and those with profound autism struggle equally trying to keep the left one safe Well also, the provider trying to work and keep a roof over their head. These are individual who cannot be left alone. Ever. They need 24 seven care! Often times they're larger than us parents stronger than us parents. We have no help except for to go to the emergency room. My son was stuck in hospital last year for 46 days with nowhere to go. No help no services. We need day programs Because on DVR employment does not work for these individuals! I will say that again, Washington state state thinks, sending individuals to work with a job coaches, even feasible. It is not! Our loved ones are stuck, hidden away home from the world. They must have access to a day program Like so many other states! It's an absolute crime the way Washington state discriminates within the disability community. If you are not able to hold a job, then you get no services. It's a simplest that
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The real impact on Covid was all the programming closing. The very few things that were available no longer are. Our loved ones sat at home with no services for almost 3 years! And as a result of no more programming, They are continuing to sit at home in crisis. State of Washington must create some

	<p>sort of deep programming for those High, profound autism. Employment is not the answer! That's a feel good statement that ends up discriminating within the community those who were too disabled to be in the workplace end up, sitting at home for their entire lives!</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Complete cut off from services during Covid. My son actually had a crisis. I have stated before he ended up in the hospital for 46 days</p>

Name	Esther Caletka, HOME Incorporated
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges. However, impairment in their ability to communicate any type of pain may result in behavioral outbursts, as well as self-injurious behaviors. My brother would kick walls - this resulted in wounds which would not heal for years. The inability to communicate dental pain, as well as other types of pain, could result in the complication of sepsis, requiring hospitalization (a very unpleasant experience for them), or even death.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Concomitant Bipolar disorder. When in a manic phase, aggressive behaviors are more predominant. Depression has challenges of its' own.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities further hurt these individuals. My experience, (working in a Day Hab program), has been; that while individuals are in school, they have the benefit of Speech Therapy, and all sorts of assistive communication devices. The minute they graduate - this all goes away! WHY????? It's not as if suddenly they are "cured" when they graduate! Their communication needs not only persist, but even increase, as they are expected to become more independent! THIS NEEDS TO CHANGE!!!!
What additional research is needed to help address co-occurring conditions for autistic people?	pre-natal identification Early Childhood diagnosis More education, in this area for all teachers - not just Special Ed More education for society, and neurotypical kids. More support for these individuals and their families, post graduation More training for doctors - in the 1980s I provided a clinic site, and taught Pediatric Residents about autism and D.D. One of the OPWDD MDs, recently referred to this as a positive experience, which paved his path to his current career. Training for Law Enforcement.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Greater research into, and greater understanding for all of society of Sensory issues, and sensory needs. We need more housing, as well as supports for older parents who choose to care for their adult children. Many cultures do not believe in sending their kids out to be cared for by "strangers". We have CDPAP for certain populations - why not for those with autism/DD/ ID
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Programs shut down. Some with autism were not able to receive remote services due to their disabilities. I, personally saw a decline in their cognitive function, behaviors, some becoming more "institutionalized" - not wanting to leave home. And many of our individuals never returned to receiving their day treatment services.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Please refer to last answer. But, individuals who are already challenged with social and communication skills, were further hurt after we shut everything down. Also, many with hearing impairment, and other communication impairment rely on reading lips. Masking further disabled and hurt these individuals.

in-person social interactions and obligations)	
--	--

Name	Ethan, Care Giver/spouse
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GI issues, Sleep, Sensory over stimulation with day to day things.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, aggression, suicidal thoughts,
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Effects of stimulus. effects on Adults (separate for both male and female).
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage. Support systems, therapy, Schooling, Accessibility of services to adults instead of just children
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	When everyone is inside, it was easier for my spouse to feel less pressure/stimulus when we were to go out of the house. Was also easier to maintain a routine in daily life easier.

Name	Eugenia Ramsey
Demographic	None Indicated
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Health issues become acute as early signs are not addressed because the person with autism is not understanding them to let a person know that something in their body has changed. Acid reflux learned from enamel on back teeth were etched. Constant bowel movements with no control found person with autism had Chrones disease. Testing in blood can help diagnosis. Please study sounds, body positions of the autism person to give doctor clues as to what area to examine and test.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)

Name	Evren Wiech-Barnes
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GURD/IBS, sleep difficulties, GAD (generalized anxiety disorder), PTSD, most of which occurred after the age of 18 after years of trauma from parental abuse and school mistreatment. These compounded by office politics and other neurotypical niceties, backstabbing, and other nonsense that creates a toxic environment to get work done. Masking becomes a necessity to survive, but ultimately causes burn out. After years and years of burn out after burn out this causes severe disability. Parenting, schooling, and work life needs to change for us to function. Medication is NOT the answer.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have PTSD and GAD. Neither happened in because I am Autistic. They happened because of the neurotypical world does not accept an honest, justice-seeking, uncompromising, feminist woman that doesn't waste her time kowtowing to men or people-please to be liked, nor did my parents like a child that smarter than they were. In a supportive environment, it's highly unlikely that my gifted natured would have resulted in disability.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I don't have intellectual disabilities. I have a very high IQ. I did, however, have delays in understanding neurotypical communication, but I believe that is a two way street. I believe it should be both parties that need to learn each other's language, not just treat me as deficient for not being, thinking, or communicating like you. That is outdated thinking. I am not a defective neurotypical. I am a perfectly normal autistic neurotype person. I don't suffer from Autism; I suffer from a world not built for me to thrive, and because that the world was robbed of my intellect and capabilities. I have a master's degree I cannot use because bubbly dispositions are favored over genuine work. Absolute waste.
What additional research is needed to help address co-occurring conditions for autistic people?	Stop treat us as if we have "deficits" because we are not like you. Improve how you recruit Autistic people for studies. Regularly ask the community what we want and need. We desperately need services to help adults that are LEVEL 1 on our career and life path. We want to work. We want to function. We need workplaces to take accommodation and staff education seriously. We should not be paid less for our labor when we give equal work as any other. We should also have training to start our own businesses if we cannot function in an office setting. The goal should be to allow each Autistic person to be all they can be and tailored to their specific needs and challenges. Please put money into researching this. Stop trying to "fix" us and start trying to work with us. Maybe put money into researching parenting practices. Or even better stop funding ABA because it's nonsense. Teaching us to obey is not teaching to do more than mask to make others feel more comfortable around us. I don't see how their comfort is worth my mental health.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Fix the world you throw us into and leave us to the wolves to survive in. I wouldn't need anxiety meds at all if I didn't constantly live in fear. I lived in fear of my father, my classmates, my bosses, etc. I am stuck in fear. Now that I'm here, maybe take klonopin off the "controlled substance" list because it makes getting the one simple dose I have been on since 2001 a nightmare each month. Chasing down doctors for scripts, fixing communication between dr and pharmacy, dealing with my own executive dysfunction to remember to start the process each month is all a nightmare and exhausting. So the world messed me up and now it is my job to fix your systems to make sure I can cope? Maybe fix that.

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I believe I may still have a lung infection a year and three months after my Covid infection. I may have heart damage. It is unclear. Tests are on-going. I am extremely angry at the bungled handling of Covid from the previous administration. Each body is different. I don't know what others are facing.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I love tele-health. I dislike people. I was fine with isolation. It didn't bother me a bit. I do like that some work from home jobs have remained, but there should be more. The idea that overhead or micromanagement is necessary for quality work was proven false. Yet tons of companies are demanding a return to the office. It's bad for all disabled people (social model or otherwise). This should be addressed with corporations. Remote work could mean less reliance on social security.</p>

Name	Ewa Omahen, PhD, Retired school psychologist
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	In addition to co-occurring medical conditions listed, communication and language challenges are a significant issue that needs to be addressed more effectively.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	There needs to be more research, training, funding and resources allocated to AAC. The current emphasis is on behavioral treatments, such as ABA. These treatments are inadequate in addressing complex communication needs of autistic individuals. The AAC methodology and best practices need to be taught to all professionals, including educators, private providers and medical providers, caretakers and families in order to support access, introduction and development of authentic and robust language system to all complex communication learners throughout a lifespan. This access is currently limited in spite of the technology being available (communication apps, devices, etc).
What additional research is needed to help address co-occurring conditions for autistic people?	*More research, resources and training dedicated to AAC *There is limited evidence of the effectiveness of ABA in this population. Other therapies need to be explored and studied. There needs to be better funding in special education and private therapies beyond ABA, including OT and speech and language therapy. *More emphasis on the interplay between diet/gut amend brain/behavior
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better training of all educators and professionals in autism Partnering with and empowering families and autistic individuals Better funding for therapies other than ABA, such as speech and language and AAC training for all Easier access to quality comprehensive medical care including mental health.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Fin Finney
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I struggle with vertigo, joint pain, pelvic floor dysfunction, and untreated eyesight dysfunction due to passing regular exam methods.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge is provider bias against treating multiple issues. If I have one thing down, I feel locked out of treating the other. For example, being diagnosed with anxiety and not receiving any additional diagnoses or treatment after suicide attempt. As an autistic adult I have had to self advocate to even discuss autism in an evaluation setting, and have been met with direct opposition to more than 1 diagnosis (in addition to PTSD). As a public health community advocate and educator, the number one complaint I hear in relation to autism is inability to get a diagnosis. The second complaint is the risk of violence that comes with diagnosis with a primary concern for Black children.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	It feels impossible to get them treated if you don't present in a very specific way. As an adult I have to bring these topics up to my provider and build my case, despite the fact that I was (improperly) screened for these issues as a child. Providers universally lack an understanding of autism, and I as an autistic person have had to dedicate multiple years to fully understanding how to navigate my condition without causing myself further harm.
What additional research is needed to help address co-occurring conditions for autistic people?	Lived experience data from autistic people both qualitative and quantitative and always paid. Study pilot programs that create greater accessibility of autism diagnosis and greater accountability of provider harm.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access, consideration of SDOH, challenging requirements for formal diagnosis at the funding level and provision level, communication training for healthcare providers, consideration for autistic equity in development of mental health processes/funding/resource development. At all levels, treating autistic people as collaborators and leaders in their own care.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I have no more trust in service providers. I have wasted so much time and money trying to be treated only to find myself making more progress at home with no support than I did while trying to navigate seeing multiple providers. I am burnt out on having the same conversations about weight and diet, anxiety and depression, and mild exercise. Understanding polyvagal theory and treating my nervous system as a real part of my body took ONE book and a few minutes of research to do. Why aren't providers trained to provide care that has been proven to increase self efficacy? I want to trust my providers but I am overwhelmed by the grief of all my failed care. The provider in these situations will face no harm at their actions, but I will lose all of the resources that could improve my life outcomes. When people come to me seeking support getting an autism, or any diagnosis, I feel fear for the misdiagnoses from provider bias they might face, and I feel hesitant to encourage conversations with general physicians whose advice on mental is, in my and my communities experience, not helpful at best on mental health topics.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Untreated long Covid and the exacerbation of existing untreated conditions Lack of health equity programs and lack of development of real plans that involve community collaborators at all levels. Loss of valuable social autonomy. The groups and programming that were once available online too have gone mostly in person with no mask requirements. As someone with multiple conditions and a history of provider bias I am hesitant to raise my risk of experiencing long Covid symptoms when I have seen the real harm it can cause first hand in my community.</p>
---	---

Name	Firos Shamsudeen
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	my daughters 14 year, most challenging part on physical health, she is not able to tolerate any pain and become very hyper active if she has any especially during her periods. Lack of eye contact, have sleep problems.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	facing lot of behavioral issues including hyperactivity and not willing to interact with anyone and always want to spend time alone in any corner.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	have communication disabilities since not good in English and her native language is different. Comprehension is very poor.
What additional research is needed to help address co-occurring conditions for autistic people?	No much therapy option found for children more than 9 year. We are facing this issue to get her any services like speech or behavioral therapies. Also looking any occupational therapies. We have good trainings in public school under Rockwood school district, however we are unable to find any resources on how we can improve her through extra services outside of school hour.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	1. Need to have more sport programs to participate for autistic children. We found one basket ball training but trainers were not sure about to give training to autistic children and we didn't go. 2. Insurance should be covered more for autistic children with lower copay. 3. More sessions and awareness is required for parents and family members who has autistic children. Frequent sessions create a supportive community where parents and family members can connect, share experiences, and provide emotional support. This sense of community can be invaluable in coping with the unique challenges of raising an autistic child.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	since autistic children and other differently abled people will have limited communication ability it is good to have special covid-19 clinic or service for them.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	service availability is very important

Name	Fraida Flaishman
Demographic	Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory challenges, motor challenges, sleep challenges, gastro intestinal challenges and feeding and eating difficulties, social engagement difficulties, self regulation difficulties.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	anxiety, aggression, self-regulation challenges
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	learning difficulties, language and communication deficits, developmental delay, self regulation challenges, social engagement difficulties.
What additional research is needed to help address co-occurring conditions for autistic people?	1) auto immune and gastro intestinal prevalence with those with autism to identify if they are at risk for occurrence of autism based on their physical related issues to determine early prevention methods. 2) The difference between individuals born with autism or those that developed autism in early childhood 3) How to differentiate autism for other similar presenting conditions 4) Determining which interventions are most helpful for individuals with autism 5) Identifying the possible causes of autism including if environmental toxins may be causing or exacerbating individuals with a predisposition for the disorder
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	parent and physician training for identification of autism and related symptoms, education about services available for diagnosis and intervention for those with autism including the related deficits, education about the different diagnosis and interventions families can access to support individuals with autism as well as their family members.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	This is an individual question based on the personal experience and environment of people during that time period. I have seen cases were families and children struggled during the time that schools and program and support were put on hold including those that recovered quickly and others where they are still struggling including needing psychiatric supports because the change of routine was difficult. It was most difficult for families to cope when their support outlets including school and vocational programs were not available for the individuals with autism.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Change of routine, lack of family support, and disruption of service has been difficult for families. Remote therapy and telehealth are a positive alternative but does not work in all cases and cannot be compared to in person treatment.

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Frank Camilleri
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	From my lived experience as an autistic person with an autistic father and autistic friends, sleep issues are a core, if not the core issue with being autistic. Yes, sensory challenges can be disabling, but putting on gloves and noise cancelling earphones are viable treatments for those issues. If I can't sleep (which I can't, as autism has blessed me with treatment-resistant insomnia) then all the other challenges that come with being autistic become impossible to navigate. According to recent meta-analysis of autism sleep studies, there are no treatments outside of melatonin that have been researched for autistic minds, and most neurotypical methods won't help because of the changes that autism brings to the Default Mode Network of the human brain. Currently, I am a college educated software developer that was making 150k+ in 2022, but could not work in 2023 because I cannot functionally sleep. That's ~30k in tax dollars that the government has missed out on.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	From my own lived experience, ADHD, chronic fatigue, and the isolation brought about by the proven Double Empathy phenomenon have posed significant challenges to how I'm able to interact with the world. The fact that autistic people and non-autistic people have completely different non-verbal languages and mannerisms is a very hard barrier to overcome.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities, by far. Most autistic people I've worked with don't actually have learning disabilities or intellectual disabilities, but have been labeled as such because the world will not work with the method of communication that they are able to employ.
What additional research is needed to help address co-occurring conditions for autistic people?	Sleep research most importantly, and how to teach autistic communication to non-autistic people, and vice versa.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Get rid of private insurance entirely. As a nation, we will have no motive to solve any of these problems if we're not able to prioritize it as a common goal that all people need to deal with. Also, it's extremely hard to navigate a system when every bone in your body is telling you "this is morally wrong, and logistically inefficient."
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	The reduction of in-person business interactions and obligations has been a massive boon for autistic people, especially when paired with the massive improvements made to online systems during the pandemic. However, the reduction of in-person non-business interaction has made socializing as an autistic person [profanity redacted] near impossible. We live in a country of only work and sleep, there is no joy.

in-person social interactions and obligations)	
--	--

Name	Freya
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues Behavioural challenges Sleep trouble Disordered eating
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety Extreme mood lability ADHD Aggressive and violent behaviour Social difficulties Low self esteem
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities Learning difficulties (attention and concentration)
What additional research is needed to help address co-occurring conditions for autistic people?	More research into pathological demand avoidance profile of autism and presentation in girls
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Cost of assessment, diagnosis and services Equitable access to above Wait times to see Specialists and Allied health professionals
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	negative impact on routines More ability for carers to work from home and flexibly to be present and support

Name	Gabriele Arnhold
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastroenterological comorbidities (in my case CIPO). And I am prone to (vasomotor) migraine attacks
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, attention-deficit disorder (without hyperactivity), skin picking, Morsicatio buccarum, thoughts of "wanting to die" (not planning suicide, but I always wish I were dead, because the thought of having a longer life without any help and without any familimembers is unbearable)
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I will never have enough money to support myself because I will never ever get a paid job. And I will always be on my own and will ever be in danger of being abused by other people.
What additional research is needed to help address co-occurring conditions for autistic people?	Research. Just resarch. Especially on rare diseases like CIPO or Mitochondrial Disease. But our lives don't count. We are irrelevant to (our) society. So you will never do research that will help us autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Service that is tailored to my needs would be of great advantage. Unfortunately, there is no help in my area for autistic people who do NOT have an intellectual disability. I was told that because I was highly gifted, I could not get help. They also said it wasn't okay that I also have a physical illness/disability, that would be "too much", I was told that it would be cheeky and brazen for me to go out in public with this multiple disability and ask for help.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	All help I got was canceled. I was cut off from medical help and my condition worsened. Health service for people like me were never established again like before. After the pandemic was over people were more selfish and I was told I should go to gas, I should die, I was not worth living, my life would not matter. The pandemic taught me that I won't get any help if it gets really bad. I lived more isolated during the pandemic and never got an infection until in 2023 kind of all inhabitants of the nursing facility my father was in were infected by a a doctor who did not follow the precautionary measures. I was infected by my father. My father died. We were both vaccinated.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The pandemic taught me that I won't get any help if it gets really bad. And I learned that remote work is possible, but not for individuals with disabilities because nowadays many people want to work from home and people with disabilities are just too much now.

Name	Gabrielle Connelly
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Food. Extremely restricted diet, a lot of struggles around eating. Losing foods. Struggling to eat a healthy balanced diet. Limited food choices under 5 options for a non speaking autistic child. Need better development in food programs. Sleep. Years and years without proper sleep. Needs medication to sleep. Up frequently. Toileting, suffers from constipation issues constantly because of inability to use the toilet.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression and exhaustion when hungry or tired. Physically uncomfortable when constipated. Fighting constipation daily. Food we have to drive to get specific foods so that he will eat. Self injures when frustrated due to sleep, hunger and physical discomfort
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Developmental disabilities, no awareness of danger. Not aware of others near him. Hazards near him he will trip and fall. He also injures himself trying to regulate himself. Communication cannot tell us what he needs if he's hungry or hurting or upset
What additional research is needed to help address co-occurring conditions for autistic people?	Food therapy, sleep disorders, swimming lessons need to be offered through health insurance to prevent the leading cause of death for autistic individuals which is drowning
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, access to autism schools for all children who need it. Swim therapy. Food therapy. Better research on sleep disorders.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	When COVID-19 hit, we lost a lot of foods that my son used to eat due to people stocking up in their freezers and the inability to get his preferred items. we have not gained those foods back, and it's been years. it took us years to get him back on track from potty training when COVID-19 hit he started urinating everywhere and anywhere with no rhyme or reason. we are still trying to undo what the pandemic did for his development
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	we are still seeing a disruption in his services. We are still seeing a huge lack of staffing that has just not been back to what it was before the pandemic.

Name	Genevieve Chaput, mother of 21yo with autism
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders, sleep disturbances, sensory issues (from my experience with my son).
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Severe anxiety, depression, paranoia, outbursts of anger and frustration, thoughts of suicide
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities, SOCIAL disabilities (my son does not understand context at all and cannot read a room), developmental disabilities in early childhood, communication disabilities (many autistic adults that I have met have stutters and obsessive thought processes). Intellect is not an issue. These people are just as intelligent as others, but a disconnect occurs between the brain and the mouth or motor control.
What additional research is needed to help address co-occurring conditions for autistic people?	Comorbidity of autism and schizophrenia, comorbidity of autism and depression from inability to socialize with neurotypical community
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The biggest issue is accessibility to services like respite, GROUP HOMES for adults, social security disability services and Medicaid. My 21yo son holds a part time job (with great understanding that his outbursts are from autism) but cannot get Medicaid or social security services because he is not physically disabled. We have been fighting this for 3 years now!!! He will NEVER be able to afford his own place and is unable to understand how to pay bills. What will happen to my son when I die? He won't be able to keep the house. Who will take care of him? How can I teach him to be independent without social services and available group homes for him to live in with a CNA to check in on him or group mom to ensure the place is clean, bills are paid, etc.???? Adults with disabilities are often abused and have little to NO ACCESS to services. Their parents take care of them until they pass away and then these adults are left homeless and without access to help if they are trying to hold a job and be a functioning member of society. PLEASE HELP!!!! My son must hold a job with routine and feel useful or he has additional mental health issues. I cannot allow him to stay home 24/7 just to get social services. He would hurt himself and others without having his job. Please, please help fill this gap for those who are trying!!!! I am so scared of what will happen to my son when I'm no longer around to help him and all my family is gone.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increased risk of cardiomyopathy, anxiety and paranoia
What lasting positive or negative impacts have societal changes due to	Severe PTSD from being quarantined for a year with little contact with the outside world has given my son increased paranoid delusions of "other

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

people coming to hurt/get him". He regressed in his social skills because this occurred during his senior year in high school, reducing social interactions in-person. He is very anxious and medicated for his anxiety which I believe was exacerbated from being quarantined during BLM protests, the Trump/Biden election, and the insurrection. The inability to decipher what is realistic versus what the news/social media put out is an increasing concern. His paranoid delusions are fueled by the inability to communicate and socialize with peers, accompanied by outrageous claims by social media and news from the fear-mongering used to get "watches", "clicks" and "likes."

Name	george knoth
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	sleep disturbances and severe aggression
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	aggression and self-injury
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	can not live independently needs 24 hours a day care
What additional research is needed to help address co-occurring conditions for autistic people?	what is causing severe aggression in this population, what meds work best to control these behaviors
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	need for better services for housing especially when family is gone, no place for these individuals to live and then when family is gone the state needs to place in a emergency shelter, no long term planning for this aging population
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	support staff is exhausted from pro-longed care when agency's were shut down
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	disruption in level of service no opening in group homes to provide 24 hr care or to provide direct care, shortage of staff

Name	Gerald Wilgus
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Issues with proprioception. This led to poor coordination and was a barrier to play and sports.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Paralyzing social anxiety. Especially during teen and young adulthood this kept me from realizing benchmarks for social involvement and relationships.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I was highly intelligent and at a time when autism was rarely diagnosed people thought that I was normal and that my social isolation was a choice.
What additional research is needed to help address co-occurring conditions for autistic people?	Don't know about research. Rather appropriate help for ASD-1 individuals in social coaching would be good.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easy access to services that would provide ASD-1 individuals having challenges with delayed social maturity.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None. However, I think it is scandalous that effort was made to help NTs with mental health issues stemming from isolation especially when no effort has ever been given to provide autistic individuals with help when they were isolated.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Social isolation of children. Welcome to my world. I have no empathy towards those people when the message I have always gotten was "deal with it."

Name	ginamarie
Demographic	Other
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>finding doctor in home area base that function my needs level to safe guard and health care me proper. i be the told go to morristown for my complex health needs so i be have better quality life... no transport services to get me there never the mind there be hospital 3 miles from where i be lives and many network doctors. this no okay. blue envelop for the police - this be wonky no train inform proper and u poop the bed thinking when we stress trigger etc that we be remembers calm blue envelop give police never the mind the police lack of training for us this be sensory stress direct relates back our health. if we no feels safe and have proper doctor we no have quality life. sleeps extreme import, isolation connection to health conditions, my function level impair to receive understanding doctor to listens. i be go ER and no respects no have call button ask for social worker - it no until the doctor come down visits me - he be say i be see you here want come check in you and then the care improve for me why no treat with the same respects - it no matters be on the spectrum label. and yet you wonders why people of color have more complex health issue - it be yet another box that be dismiss no respect proper.... snowball hurt our health complex issues etc</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>behavior and having my boundaries violated - my health file must be disgusting . here be one sample. blood works i be ask butter fly needle my hand please - (note it be the prime office so they be awares me have do the bloods before) the person say oh the no we like do the arm. then they poke me both arms no vein and then wants try fish around my upper arm above elbow - as the if. so i repeat my hand please use butter fly - again the health worker dismiss my request. so then i be have the behave issue irrate label other negtives cause why i no want be human pin cushion and no respects my ask. consent dismiss in health care setting has the many negtives that give us triggers of depress anxiety adhd etc.... labels but please over drug us that then snowball side effects - which many cause other health probs concerns even the behavior issues..... least we keep you making money the system right....</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>the intellect - communicates and learns be extreme hard. i be got the covid again and stress so bad i be no remembers just take aspirin for my fever.... many the doc office no use simple word language break down repeat steps need for care level for when we alone... there be a disconnect in the understandings of level care requested that especials the push for use on the line - that no options proper for me so many my basic needs no go connect proper. like when got the stitches i ask for instructs and still need call office i be got infect cause i take longers to heal - another snow ball health concern.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>i feels the services and resource and doctor office and teachers area be more worse to so the call encounter help empower my life then the complete strangers be. these folks be trained vetted degrees etc - so why the moron oxy? when i ask for write down please take notes please record app please - i get push back dismiss. and then when need questions ask help like with the stitches it be alarming the responds i receive. another be the abuse we be receive from same areas of the services resources in place to allow us full function. i feels some times the label cause more damage and the judging of the box slam me in relates. i feels many the research and grants no go deep enough - the impact be yet another island to self - no deeper connection to make a true impact for those us on spectrum in this nation. we be a money making machine - and u be over drug many us that be have another entire area need of research side effects etc. sample u put me on a cheap</p>

	[profanity redacted] drug predzone and at no time relates that to me now have sugars health probs until i see a differ doc that tell me stop take the predzone and oh my my sugars go back normal range.....the level of basic disconnects over site be hurtful cause it be hinders our life level function - a life function that already considers not normal
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	all samples you be listed and heal our nation to actual care for the living..... another trigger moron oxy - abortion become much illegal but the abuse and dismiss and departmental no qualty level care connections for my life be alarming. some the system created and set up to be islands of money making machines so i no sures how to improve this without stop the cash cow greed and thinking for some reason we be less than human cause we be have a label and differ needs. last time check ever person be differ and ever person be have the unique needs
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	i be have more visits the doc office - my function level be less - i be told it no more safe me try push self do many the things cause my immune be the low high risk of ables get the infect. yet the mores isoates be the more i becomes the high risk to have infect illness.....i be got the covids more one time now and i take longers since the covids for health improve ever thing. the stitches take longer close heal. a bruise.....sleep less....get more alergys....another snowball result that no make the since and it wonky cause many docs no respects to answer my questions and the or take times - sevral them want just pill me - like oh you no ables sleeps we give you the sleeps pill yet i be test and told i be hypoxemia so is the sleep pill make health care wellness me a good option???? alarming
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	the telheath no option good for me - when covids come in no have intrnet so how gonna do that. making big assumps that we ables app on phone to with our differ function levels. services stop and still stop and the or change for less, i less physcial connect to others and i be hard time many things. i feels i be much worse my functions cause of the covids and i live in new jersey - it extreme wonky depend where in state lives for so the call state program resources service cause the limits be no active yet service be state wide program then i be have no helps. lost my case worker - then new one be part time and send me wonky text then ignore me when i ask no text me call me please. etc just hurtful

Name	Glen , The Jewish Guy Business venture PTY LTD
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Indeed, knowledge is power and malongi ma ndona madungu... positivity is accepting reality rather than living in false hope
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Indeed
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Glenda Hayes, Grandparent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Textural issues related to types of foods eaten. He tends to only eat certain foods which creates concern with getting a balanced diet. Other issues include the "walking chicken gait" and uncoordinated chewing which causes bits of food to be expelled during meals.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There is anxiety about social issues and making friends. There is great sensitivity and worry about health of beloved grandad who has health problems.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Grandson learns easily but is convinced/very resistant to homework that he sees as totally unnecessary "because he has been in school all day". Test grades very good but homework grades poor. Probably related to desire to play video games after school.
What additional research is needed to help address co-occurring conditions for autistic people?	Education for parents to avoid issues of video games or create video/educational programs to address problems seemingly from autism. Also for kids with gait or stemming issues, physical education teachers could employ PT or OT techniques in helping those students. Ex: That could be exercises to strengthen the core.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Special Ed teachers might have training in these areas to address particular issues. A school which has special ed classes, might also employ a PT or OT to serve students with necessary therapies without taking child away from school, for regular treatment.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Our students in SC did not lose as much in-person school time as many states. The stress and anxiety increased over Covid in parents, grandparents and friends.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Doing school at home was very challenging to keep on task. New math for an old grandparent 🤔. Talking with a therapist over the phone seemed ok. The child was open, maybe due to not having to look directly at the therapist.

Name	Gloria Derosa
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My daughter has Pitt- Hopkins , a rare severe form of autism she has severe gastrointestinal issues, needs daily medication, and a bowel program.suffers quite a lot of daily physical pain due this She also receives daily medication for a sleep disturbance, sometimes it works, sometimes she will be awake 24 hours a day for 6-7 days per month She is non verbal, has no communication system, despite many years of efforts by therapists and teachers She takes medication for a type of seizures She in not mobile, uses a wheelchair
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Angela has periods of anxiety, aggression and some self harm behavior.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I think the most significant Challenge is communication She has no means to communicate her needs and wants, she cannot tell us what is wrong or what is bothering her medically. It is difficult to form relationships with other people, because she lacks the reciprocal communication with others
What additional research is needed to help address co-occurring conditions for autistic people?	I think a big one would be researching the gastrointestinal disorders that people suffer from it really has a negative effect on their quality of life. another area of research should be communication for non verbal persons with Autism. Many of the speech therapists are only being trained for working with “mild” speech disorders but lack any training or expertise in working with non verbal individuals.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	One big issue is how services, therapists, doctors etc disappear once an individual turns 21 and leaves school. Another issue has been access to health insurance. Angela has a Medicaid waiver which we are very grateful for, but often doctors will tell me they are not taking any more Medicaid patients. I am paying for private insurance that is \$ 1,200 a month out of pocket along with other medical costs. Because of the intensity of my daughter needs , the shortage of caregivers, I retired “early” after 30 years of teaching, a living wage for caregivers would encourage others to become caregivers.. There is also an unintended consequence of the tax laws concern ing parent/family care providers 2014-7, difficulty of care payments, they do not take federal income tax out of our checks, but they also are not taking social security taxes out , which will cause some parents not to be able to earn enough quarters to qualify for retirement benefits and/or their social security checks will be greatly reduced.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Covid terrified us, we didn’t take our daughter out in public for 2 years. Disabled people are more likely to die from Covid or suffer lasting effects. My daughter missed 2 years of schooling, and vital communication and physical therapy, and 2 years of transition services. the district offered a couple hundred dollars in compensation but that would pay for MAYBE 2 therapy sessions .
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	All of the above were affected! Zoom dr appts, Decided not to pursue Department of vocational Rehabilitation services. On line school & services did not have any benefit for her. Less social interactions

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Grace, Autistic person
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory sensitivities can exacerbate physical health conditions and also cause the individual to experience conditions more severely.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Alexithymia can make emotions hard to identify and understand for autistic people like myself. Additionally perseverance and literal interpretations can cause negative thoughts to spiral for us and we can take our own thoughts as absolutes. Additionally we have variances in neurotransmitters and therefore are prone to complex experiences with mental health and emotions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities face significant exclusion in all areas of support and rights. AAC users can communicate yet are often on the fringe of society being left out of all relevant discussions.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Providers need person centered training to help autistic people with co-occurring health issues as they currently disregard our own lived experiences and our conditions go undiagnosed and untreated or misdiagnosed and inappropriately treated. Additionally we need better insurance coverages for diagnosis, and supports that are NOT ABA.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Grant D. Sparks, MS
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory overstimulation stands out as the most impactful physical health condition that autistics experience, as the overload of the nervous system dysregulates all other physical, mental, and emotional systems within the human body. Overstimulation often leads to “meltdowns”, which leads often to the inability to regulate whatsoever or a complete shutdown of outward functioning. This impacts hygiene, health and wellness, diet, exercise, communication, sleep, motor function, and all other elements of a person’s physical health. Often, overstimulation leads to a state of catatonia that renders all other elements of physical wellbeing moot.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	As one might assume, having a nervous system reaction that forces shutdown has drastic impacts on a person’s mental health. Depression, anxiety, self-harm, obsessive-compulsive disorder, and unstable attachments are a common experience of the autistic community, due in no small part to the impact of their nervous system responses. Being forced out of work, social interactions, passions, hobbies, or often basic activities of daily living by one’s own brain has significant mental and emotional impact. Self-harm and detachment from loved ones are often used to wrest some semblance of control over this experience, often only complicating matters further for an autistic in a spiral.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Unfortunately, considering the last two entries, I suspect the most significant challenge regarding other conditions that co-occur with autism is misdiagnosis and the resultant inaccurate treatment planning. Given that much of an autistic’s ability to communicate, self-express, and engage in the environment around them is contingent on the cooperation of the nervous system, I believe that many individuals with ASD are misdiagnosed with other disabilities because they are not able to accurately replicate standards of “ability” that are set by individuals with self-regulating nervous systems and the average neurotype. Many an autistic has been labeled intellectually disabled by undertrained or misinformed diagnosticians, not due to a lack of content understanding or intellectual ability on the part of the autistic person, but due to the inability to communicate this understanding in a way that is deemed “appropriate” by the governing bodies of medicine and psychology.
What additional research is needed to help address co-occurring conditions for autistic people?	Research is needed on autism as whole, and how to work with autism rather than how to force autistic people to function “normally”. As well, we require more research on effective ways to help regulate the autistic nervous system in a way that is not suppressive or harmful. Additional therapies, medicines, and systemic approaches should be studied, and these studies should, whenever possible and with the highest priority, be orchestrated, lead, and overseen by autistic people. Neurotypical bias needs to be removed from research into autism. Focusing on developing methods for coping with the resultant depression, anxiety, and other disorders that stem from the debilitation of the autistic nervous system would be of major benefit in the treatment and care of autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services,	First, autism should be wholly recognized as an immediate qualifier for disability services, social security disability insurance, and subsidized healthcare. Far too many autistic people exist in state of perpetual agony due to their forced participation in a society that does not provide adequate accommodations for their needs, often suffering in silence due to an inability to adequately portray their internal experiences. Research suggests that

<p>insurance coverage, service systems issues, patient-provider interactions)</p>	<p>something like 85% of autistic people are unable to maintain employment, which in turn leads to the exacerbation of all the symptoms listed above due to reduced or removed access to care. It is notoriously difficult to qualify for social security disability with a diagnosis of autism spectrum disorder, stemming from the inaccurate attitude of many neurotypical agencies of “if you’ve held a job once, you can do it again.”</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Simply put, Covid has mostly made everything much worse. Those autistic people who had successfully learned to mask adequately enough to function in a neurotypical society have regressed substantially due to the social isolation of lockdown; and while from a mental health perspective, living an unmasked life is substantially less draining, it also means living with more pronounced and impactful symptoms. Those without that ability have found themselves even more isolated than before, and with more restricted access to the limited services available to them in the first place. This has led to a net worsening of the autistic experience overall.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>On a societal level, one positive is that people who have existed with undiagnosed autism are starting to recognize their need for care and support. The idea that remote work or school is a fix for autistic engagement is rooted in the neurotypical mindset and extreme capitalist values. Just making a job more accessible to someone doesn’t mean working will be any less overstimulating or agonizing for them. Telehealth has been somewhat beneficial; however, the problem remains that nearly 85% of autistics are unemployed, meaning access to services is restricted to those who show extreme disability.</p>

Name	Greg
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep and eating. If I manage 6 hours of sleep it's a good night. Once I wake up I cannot go back to sleep as my mind snaps awake and nothing short of chemicals can shut me off. Avoidant eating and maintaining weight is difficult.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression. Creates a loop in my head and I end up coming to the worst conclusions of every interaction. Makes me see knives where there aren't.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication. You don't know how important it is until you are literally unable to express your feelings
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Any service for autistic ADULTS would be nice. I wasn't diagnosed until my 30s and it's impossible to get real help at all.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive to a degree. Work from home is a perfect environment

Name	Gretchen Stewart, Center for Learner Equity
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Co-occurring health conditions can be significantly downplayed given an ASD overarching diagnosis. For instance, neurodevelopmental disruptions that manifest in motor differences which are in turn required for many mind plus body actions linked to independence (driving, hygienic, writing, etc.) can be under treated or ignored. For school aged children with Autism in K12, many states have guidance that prevents school based therapists from working holistically with children as they are restricted to narrow clinical focus. Too, given the dearth of developmental pediatricians available to families, parents are often directed to ABA as an end all be all therapy, rather than therapies that include a range of treatments for co-occurring conditions.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For an individual with Autism, all of the above listed alone without Autism are know to be correlated to lower quality of life - under or un employability, social stratification, and mental health concerns. With Autism, those effects are intensified.
What additional research is needed to help address co-occurring conditions for autistic people?	I would start with more funding for neuroscientific root cause research that results in translatable intervention for co-occurring conditions. For instance, motor differences. Researchers, including those seminal in defining the characteristics of Autism more than 60 years ago, have been evidencing links between brain plus body both structurally and functionally. Put more RFPs out for this kind of work in conjunction with practicers to develop new approaches to intervention.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Remove therapy session limits from insurance. Widen insurance approvals for holistic modalities (music therapy, hippotherapy, chiropractic, etc.). Encourage new pediatricians in training to become developmental peds.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	

in-person social interactions and obligations)	
--	--

Name	H
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Anxiety, demand avoidance or inability to do most things during times of shut down or burnout, sleep disturbances
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Heightened anxiety that doesn't respond well to CBT and leads to depression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	School not working and exacerbating challenges
What additional research is needed to help address co-occurring conditions for autistic people?	How to effectively treat anxiety in people with different social/emotional awareness levels. Where demand avoidance and inertia comes from and how autistic people can accomplish their goals while dealing with the challenges of demand avoidance.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Where we live, there is a big push towards ABA as the main "evidenced based" treatment that government funding money can be spent on. This needs to change so that autistic people can allocate their funding allotment towards a wide variety of supports that they choose according to what they know would be of help to them, this should include things like using funding money to pursue special interests.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased used of telehealth and remote school options is something we continue to enjoy and make use of on a regular basis.

Name	Harriet Stuart
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal issues, migraines; allergies Child can not express pain and acts out with SIB or grabbing others.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Inability to express discomfort leading to inappropriate behavior.
What additional research is needed to help address co-occurring conditions for autistic people?	Connection between gut and brain; behavior analysis to help communication.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Appropriate residential and training services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Since COVID, there has been a serious shortage of direct support professionals.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Service disruption for those who need structure more than typical age peers

Name	Heart of Texas Behavioral Health Network
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	A large majority of mental health care providers are uncomfortable or unwilling to work with individuals who have an intellectual or developmental disorder. Many individuals who have IDD have co-occurring mental health conditions including autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	A large majority of care providers are uncomfortable or unwilling to work with individuals who have an intellectual or developmental disorder. Many individuals who have IDD have co-occurring mental health conditions including autism. Communication is a significant challenge.
What additional research is needed to help address co-occurring conditions for autistic people?	Additional research is not the most pressing issue. Putting into practice what is already known must occur ASAP. Provision of mental health treatment is seriously lacking. There are not enough providers, and evidence-based training is needed.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above examples. Access to care by providers who are well-trained in evidence-based treatments would improve outcomes and satisfaction with services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Heather
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	It can be difficult to get adequate help for them because of difficulty communicating; doctor's not really paying attention to us when we talk; lack of understanding. a HUGE problem are self-diagnosed autistics completely changing the conversation on these things, denying they are related in any way to autism, and damaging public perception on what autism is and how it impacts us.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Being afraid to be open about what we are going through out of fear of being put into a hospital or removed from the surroundings we know / placed on medications / not being taken seriously or having these issues approached in a way that causes more damage than it does help. Also, self diagnosed autistics are harming autistics by conflating other mental health issues with autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of access to proper supports, help, resources; especially for autistic adults.
What additional research is needed to help address co-occurring conditions for autistic people?	stem cell therapy, research in general. We need more funding for actual help, in our day to day lives.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services right now are mostly 'resources' that provide the numbers to other places that provide numbers to other places - it's a circle jerk of 'resource' places, with very very very few actually providing real world help/resources/supports. More benefits through health insurance for in home help, help managing day to day life.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	100 times worse. Everything is worse.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I felt more normal because more people are shut ins like me; increased remote work.

Name	Heather
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Inclusion in tasks such as going to the grocery store, or leisure activities. Not enough places are doing sensory hours, all grocery stores do not offer Caroline's carts making it near impossible to take some autistic individuals to the store. My daughter cannot go to Chuck. E. Cheese because they don't have sensory friendly hours at our location for example. More businesses need to have sensory friendly hours. Gastrointestinal issues and incontinence. Many public spaces will prohibit use of their restroom and you have nowhere to change a diaper for an older autistic child or adult who is unable to hold their bowel movement or urine. We were refused the bathroom at a Family Dollar when I needed to change a diaper.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Daycare personnel are not trained to handle aggressive or self-injurious behaviors. Kids are often kicked out of daycare and it's difficult for parents to work, but SSI is not enough to live off of to stay home with them. Autistics that elope and flop are difficult to manage in stores and stores need Caroline's carts in them so we can keep them safe and secured.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Needing assistance with using utensils, getting dressed, toileting and not being able to communicate wants and needs, but having to go to a daycare that isn't trained on how to handle autism, because we can't stay home with our kids because there isn't enough financial assistance to do so. Autistic females statistically have only a 10% chance of NOT being sexually assaulted in their lifetime due to communication disabilities.
What additional research is needed to help address co-occurring conditions for autistic people?	Take a level 3 autistic child or adult that is too old to fit in a grocery cart seat to a grocery store. Then try taking them to family fun events like Chuck. E. Cheese, Theaters, Amusement Parks, Arcade Centers etc. and document the experience then implement some means for inclusion. Provide free training to daycare centers on autism behaviors, communication and ABA therapy basics.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Provide free training to daycare centers on autism behaviors, communication and ABA therapy basics. Make it mandatory for state licensed daycares. Increase the income limits to qualify for financial support for parents of autistic children and autistic adults. Provide more financial support for sensory regulation needs and items and safety items for elopers like fence installation and GPS tracking. Having an autistic child should automatically qualify you for the childcare voucher. Due to the amount of work that we miss for our children but still have to pay childcare providers whether our child was there or not.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Disruption in services

in-person social interactions and obligations)	
--	--

Name	Heather
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory processing issues have been the most significant difficulty in my own experience and in the experiences I have observed in other autistic/neurodivergent individuals.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression associated with the difficulties of being autistic in society have been the biggest struggle in my personal experience. I am also diagnosed with ADHD and this causes difficulties in daily activity and socialization.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The biggest struggle that I have and that I have noticed in others is communication difficulties and being able to read social cues. It is difficult to “fit in” and try to navigate a world that seems to think and act so much differently than I (and other autistics) do.
What additional research is needed to help address co-occurring conditions for autistic people?	More research into how autism develops through adulthood when someone is not diagnosed or recognized as autistic as a child. More reliable and research-based therapy to handle the anxiety and depression that comes with learning late in life that you have autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Reliable doctors and a more affordable option to seek diagnosis and treatment for adult autism. Better resources and services for people who need more help in their daily lives. Laws and regulations to protect those on the autism spectrum from job and housing discrimination. Though there are laws that currently do that, in my experience, many job opportunities lack the accommodations that many autistic people need, such as being able to wear headphones or bring fidget toys to work with them to help with the overwhelming sensory issues we experience at a typical 9-5 work environment.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I am autistic and had covid-19 and in my experience I had a very hard time with my memory and orienting myself even at home. The brain fog had a lasting affect on me for over a month.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased remote work I think has made a difference for autistic people seeking jobs because they have been able to get an income while being in a place they feel is safe. I have not personally experienced this, but the community I talk to has said this. I also personally think that social distancing and mask wearing has helped me to feel more comfortable leaving my house and going to crowded areas such as grocery stores.

Name	Heather
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory, GI issues, Sleep issues, anxiety, ADHD.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, Anxiety, Depression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Sensory issues
What additional research is needed to help address co-occurring conditions for autistic people?	Gifted. Many that are Autistic are also gifted and not just with disabilities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More access to Mental Health
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Heather Bourne
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	the narrow range of tolerable foods can present nutritional challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	executive functions weaknesses/ frequently comorbid ADHD can present a double barrier to accessing learning in and outside of schools-- the autism profile can impact HOW one can access interventions for ADHD, and vice-versa. My daughter has dyslexia, and her autism/ pathological demand avoidance PROFOUNDLY impacts how hard it is for her to engage in dyslexia interventions-- and in turn, her anxiety skyrockets and she feels terrible about her brain. The intersections here are each something to understand and separate out.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	executive functions weaknesses/ frequently comorbid ADHD can present a double barrier to accessing learning in and outside of schools-- the autism profile can impact HOW one can access interventions for ADHD, and vice-versa. My daughter has dyslexia, and her autism/ pathological demand avoidance PROFOUNDLY impacts how hard it is for her to engage in dyslexia interventions-- and in turn, her anxiety skyrockets and she feels terrible about her brain. The intersections here are each something to understand and separate out.
What additional research is needed to help address co-occurring conditions for autistic people?	Please: Research Pathological Demand Avoidance My daughter qualified first for a social communication disorder diagnosis, then an autism diagnosis. Yet the behaviorally-based autism interventions actually made her anxiety, depression, and family relationships worse. Only after I stumbled upon the concept of Pathological Demand Avoidance -- an autism profile, or perhaps a separate disorder-- did I find interventions that actually brought more peace to my daughter and our family. It's recognized as a mental health/ neurobiological condition in the UK and Australia but not in the US---making it so much harder to access information.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	To develop and then pay for interventions, Pathological Demand Avoidance needs to be characterized and recognized.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Over-reliance in schools and socially upon screens has brought out-of-control and unavoidable hours of screen use, and autistic brains having greater trouble disengaging from screens. We need more outdoors, in-person interventions and so many are now delivered remotely, reducing opportunities for organic, real-time social learning
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Increased remote work and school. VERY hard to activate to do things in person when remote is less of an emotional and cognitive demand-- but SO much less enriching. My daughter has both figuratively and LITERALLY developed myopia during the pandemic.

changes: disruptions in services,
increased remote work and school,
increased use of telehealth, reduced
in-person social interactions and
obligations)

Name	Heather Cellini , SLP
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Diet and gastrointestinal challenges and sleep disturbances impact nutrition intake as well as energy requirements for daily functioning
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and PDA cause meltdowns and impact participation in ADLs
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disorders and lack of access to AAC impacts autistic self-advocacy and participation
What additional research is needed to help address co-occurring conditions for autistic people?	Research on how PDA (pathological demand avoidance) and other co-occurring conditions exacerbate challenges to participation in activities of daily living
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	access to support and education for families supporting Autistic members. Insurance coverage for non ABA supports such as speech, occupational therapy, and neurodiversity affirming therapy for anxiety, etc...
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Not sure but isolation and a higher level of overall anxiety in the population can't have a great impact. Plus access to medical care is challenging even when there isn't a pandemic
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote learning has been beneficial for some Autistic students. Being able to learn in a more suitable environment is one of the few positives that has come from COVID

Name	Heather Gray
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal issues, sleep disturbance, sensory and motor challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Major depressive disorder, anxiety, ADHD, suicidal ideation, elopement
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities, development disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Anything. Access to materials, access to assistance, more neurodivergent acceptance in the workplace
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, knowledgeable providers, optional treatments not including medication, knowledge throughout healthcare
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It has exacerbated my symptoms and made it borderline impossible to function.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Going from a more controlled environment back into the work force made me feel like a failure. During COVID, I had time to exist and create a functioning routine for me. Being forced to be in public often and without choice is debilitating.

Name	Heather machin
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The lack of understanding regarding how cooccurring conditions impact the way an autistic individual interacts with the world, how they experience things and therefore how they may behave in their interpretations and responses to what is happening around them. If there is no insight into what other factors influence and compound some of the struggles autistics face, then limitations will remains with how to actually help support them in the most optimal way.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	As prior comment, without a comprehensive perspective of potential cooccurring conditions, a deep understanding of each individual condition and the intersecting points of the person's environment, culture, personal beliefs and supports, we have limited ability to offer the most help in supporting these individuals to have the optimal quality of life and feel productive in their communities.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	There is difficulty in educational systems with being able to truly accommodate individuals since there seems to be siloed and fragmented understanding regarding how conditions impact each other. Similarly, treatment is generally aimed at treating symptoms but if symptoms are overlayed by a different condition or a similar symptom origin is misunderstood, the therapeutic target may be missed.
What additional research is needed to help address co-occurring conditions for autistic people?	We need to exercise more observations and interviewing of autistic children and adults to gather a much wider net of what the experience is like, then account for the surrounding circumstances such as culture, beliefs, gender, concurrent conditions, etc, then tease apart how some of these factors might work together. We have to ask more questions.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Certainly equitable access to and accessibility of services and complete, total coverage of services. More importantly, the quality of services - after personally and professionally interacting with support services, it is breathtaking to see how different the same professionals can operate in their education, thinking and treatment execution. The quality of care can be very poor despite how it is advertised.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think there have been clear benefits and drawbacks from the pandemic in terms of help with autistic people, and these may be quite different depending on individual circumstances. It's hard to make a generalization. Some kids have thrived remarkably well once remote learning was started and they were finally able to have some relief from systems that were traditionally seen as best practice. Of course, suspension of services for some kids was difficult and lead to possible regression, but to others, it allowed some relief again. Ultimately, I think the effect of the pandemic would need to be clarified on a case by case basis.

Name	Heather margiotta
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My daughter was diagnosed 2020 with schizoaffective, 2023, gastroparesis and rheumatoid arthritis
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggressive and schizophrenic
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication, speech. Intellectual disability.
What additional research is needed to help address co-occurring conditions for autistic people?	Adult behavior programs 18+, doctors that have more training dealing with special needs,
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance acceptance by providers, specialist, adult services, ABA therapy
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My daughter became schizophrenic when covid shut down all programs . I truly believed her beeing isolated for over a year caused this mental brake. It's now 2024 and still dealing with voices, fine motor skills decrease during that period and an adult, 25 with limited help.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Negative impact. My daughter needs to be physically present, zoom sessions are useless. Mentally she will never recover from covid.

Name	Henrietta Reder, Friends of Ann Kiley Center; Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Aggressive behavior and conditions such as intermittent explosive disorder accompany many people with autism. Aggression hinders these people from being able to live in group homes and to work either in the community or in a sheltered workshop. Research is desperately needed in order to curb aggression and to find ways to address it successfully.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	As I previously stated, severe aggression and self-injurious behavior seriously prevent individuals with these conditions to live in less restrictive settings or to work at all. Research must continue to help these individuals and their families to address these behaviors. Medication as a solution must be explored as a way to contain these behaviors. The effects of these behaviors are devastating for the individual and his/her family and last a lifetime. I cannot stress this enough.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My family member has little to no speech and functions at a 2 year old level for speech but at a higher level for self-help skills. Pair this with severely aggressive behavior and intermittent explosive disorder and the result is devastating for everyone. The public must realize that all people with autism do not perform in a Broadway show or act like the "Good Doctor" on TV. Our needs are minimized and not addressed at all by the media.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on how to treat aggressive behavior - whether it's through medication, behavior analysis or a combination of both. I cannot emphasize how much my family member's co-occurring conditions have negatively affected his and our lives. Not enough services exist to help these individuals.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to services is needed. Just trying to find any are consuming. Residential services are few and far between. My husband and I were fortunate to have extra speech and occupational therapy paid by my husband's insurance when our son was young (He was born in 1981.). Not everyone had this option.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I know individuals who have become so depressed they do not want to even get out of bed. Medications provide little in the way of helping this individual. After having to go into isolation at the center where they live, trying to get these individuals back into attending the sheltered workshops is very difficult. As a result, aggressive behaviors are surfacing again.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Isolation during Covid caused disruptions in attending workshop sessions and even having visits from parents/guardians. Visits now can be done at anytime, if using the proper PPE equipment.

Name	Holly
Demographic	Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Its effect on everyday functioning - but more specifically the effect on challenging and severe behaviors (aggression, self-injury).
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	They inability to access education and safe places to live.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	More research is needed on systems level changes in schools, for example, on how to best support students with severe behaviors. The training doesn't exist, the expertise doesn't exist, and its failing the high needs students. We need more behavioral interventions that work across various environments.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Holly Connor
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The conditions all get lumped together and not addressed as its own issues. Not saying it's just a symptom of autism. For our son the challenges with sleep have been ongoing since birth. Resources to have accurate sleep studies are needed. Lack of specialist that are willing to take on the unique needs of ASD and trying to take further diagnostic test to find any underlying causes. Distinguishing between lack of sleep or underlying cause of behaviors. Another issue is having to travel to an office that only causes more stress and anxiety that then alters the outcome of any testing or diagnostic tool. Having option for house calls that could provide a more relax and natural state, might lead to less testing needed and better results to then develop a treatment plan. Sensory issue and food aversions is the need for more testing on Nutritional needs and depletions. Families should be able to get regular testing done of gut biomes, vitamin and minerals, and in-depth analysis on a functional level to be able to best support their nutritional needs. Then consideration of if diet changes are even possible and alternatives for supplementing nutrition.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Again, most mental health conditions are brushed under the primary diagnosis. The assumption that those on the spectrum do not have feelings. Taking the time to understand their perspective and then try to be diagnosed based off that and not "traditional" or "typical" ideologies.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The fact that diagnostic tools look at IQ and adaptive behaviors scores. Testing used does not look at the individual's motivation of learning things that interest them. Testing is not adapted to offer the means to understand the way they process the world. Although IQ is still a needed number, just like with autism having various levels, breaking down the cognitive ability if various categories that give a better picture of ability and needs.
What additional research is needed to help address co-occurring conditions for autistic people?	How to categorize the spectrum to best understand how autism effects each individual. The spectrum is too large and too many assumptions are made on ability based on one word, autism. When the DSM changed to autism spectrum disorder, losing Aspergers as a way to see an autistic person as cognitively able, but still needing social, behavioral, or communication supports lumped the diagnoses all together and many assume that all have low IQs. Or the contrary and people assume they are all astrophysicists. Looking at IDD-intellectual and developmental disabilities and the definitions of the moderate, serve, profound, and taking it to the other side of gifted and seeing that as a cause of issues as well could be helpful. More research into the brain and how it processes information. Finite answers on the genetic side of causes of autism. Finite answers on environmental causes of autism. Research into why the rate of autism is highest in our military families.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services,	Insurance needs to see that ABA is not the only treatment. Looking at Medicaid models that offer a larger variety of services such as respite, skill building, developmental therapy, social skills, community inclusion, CHILD CARE after the age of 12. Before and after school care for kids over 12 and summer camps. Better collaboration with schools on getting services that wrap around a student and provide whole person and family support.

insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	<p>People should now understand what it feels like to be controlled and isolated against their will like many on the spectrum. One would hope there is some actual empathy that has developed on having to be forced to change to fit the "new model of norms" that autistic face every day!</p>

Name	Ian Morris
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Strangers incorrectly judge us. When a therapist told me in 2000 that I am autistic, I said that I want to keep it a secret because people will misjudge me. Since we autistics are considered freaks, we waste tons of energy masking. Masking is exhausting. Some individuals who know I am autistic tell me to mask all the time. That is ableism. We autistics deserve to be treated fairly in society.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Terrible parents who wanted me to appear "normal" kept trying to reshape me into someone people who judge them would find "normal". Normal is a setting on the dryer. We autistics are weird. I considered suicide years ago, but I got myself psychologists and psychiatrists instead. We autistics deserve to be accepted for who we truly are, not what a popular worldview considers us to be. In order work against ableism, we need to have a society with a better understanding of who we autistics are.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Some autistics have learning as a hindrance, but sometimes we autistics have an advantage in learning. The lowest my IQ has ever been measured by a psychologist is 145. My sort of autism leads me to go to the library and read as much as I can. I have had discussions with other autistics, and they tell me about the difficulty they had in school. In order to prevent ableism in schools, we need to have a broader understanding of autism.
What additional research is needed to help address co-occurring conditions for autistic people?	In order for fair research to be done on we autistics, we need to first be accepted by society as equals. We autistics are not better nor worse than anyone else in the US republic. When we are accepted as weird bu tequal we can then dp proper research on how we autistics are perceived.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We autistics are often overlooked as differently abled. We want to be accepted as part of society, and recognizing us as being different but good people will help knock down access to service systems issues. I used to work for a police department, and answerng 911 calls taught me that my autism came with plusses and minuses. I sometimes did not perceive tacit messages callers were trying to purvey. However, I could sometimes hear when someone was in trouble of physical violoence or was considering suicide in a way that neurotypcial individuals did not always understand. We autistics can help society.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I was fortunate to not get COVID-19 during the hottest years, but I understand that it could still happen. I was homeless just before the pandemic hit, and there were fellow autistics sleeping on the street. I don't know, personally, how the pandemic hit them, but since we were sleeping cheek by jowl it seems likely that fellow autistics were more likely to be positive with COVID-19.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I have discussed COVID-19 with my psychiartist and psychologist. I have monthly sessions with the psychiatrist and weekly sessions with the psychologist. Since I live on disability and spend most days at home, I am not certain how COVID-19 has affected fellow autistics.

Name	Ilana Gruber, Pennsylvania Advocates and Resources for Autism and Intellectual Disabilities (PAR)
Demographic	Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Many challenges caused by co-occurring physical health conditions in autistic people stem from difficulties communicating pain, discomfort, symptoms, or side effects from treatment. For example, challenges communicating sensory sensitivities during medical procedures can be an issue. Difficulty separating autism spectrum disorder (ASD) signs and symptoms with symptoms from undiagnosed or undertreated medical conditions is also a significant issue and can severely impact quality of life as well as delay diagnosis and medical interventions. Other challenges include disruptions in daily routine due to physical health issues and difficulty with transitions between home, school, work, or other programs while also managing visits to health providers. Many autistic people also struggle with falling and staying asleep, which can impact physical and psychological well-being and can also exacerbate ASD symptoms, such as aggressive behavior. Sleep problems also greatly impact parents' sleep, which in turn can impact a parent's ability to co-regulate and utilize treatment plan interventions.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	A. Understanding of mental health needs: Aggression, self-injurious behavior, and suicidality are symptoms of Autism and co-occurring mental health conditions that are not always received in a supportive manner among mental health care providers. Autistic people are often dismissed when presenting with mental health symptoms, leading to delays in diagnosis and treatment interventions. Many providers lack understanding of how mental health conditions are expressed in autistic people and are not adequately trained to treat these co-occurring conditions. B. Obsessive Compulsive Disorder (OCD): Research suggests that autistic people are more likely to have co-occurring OCD. Some symptoms of ASD and OCD overlap, such as compulsive, restricted, and repetitive behaviors, making diagnosis more challenging. C. Communication Challenges: Autistic people may struggle identifying or communicating emotions or trauma, making therapeutic interventions more challenging. Difficulties with social skills and self-reflection can also hinder therapeutic relationships with mental health providers and may call for tailored strategies for rapport-building, support, and interventions. PAR also recommends that the IACC reconsider listing "aggressive or self injurious behavior" as a mental health condition. Aggression and self-injurious behavior are potential symptoms indicative of mental or physical health disorders rather than disorders themselves.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Day services, schools, and other programs are often ill-prepared to adapt to the needs of autistic individuals with co-occurring intellectual or developmental disabilities. Providers are often not adequately trained to understand how these additional disabilities impact autistic individuals and how to adapt treatments and interventions to better serve this population. Other challenges that potentially affect quality of life are challenges with social growth, interpersonal effectiveness, sense of self-efficacy, ability to cope with change, and the need for increased housing supports and employment supports.
What additional research is needed to help address co-occurring conditions for autistic people?	In general, more research is needed around evidence-based diagnostic and therapeutic interventions for autistic individuals with co-occurring mental and physical health disorders. Below are several specific areas for consideration: A. Sleep disorders, including sleep medication aids and sleep hygiene. B. How to best support autistic individuals who are gender questioning or gender nonconforming. C. Treatment for OCD for individuals

	<p>with Level 2 and Level 3 ASD diagnosis. D. Effective staff training methods for supporting autistic individuals across settings in the community, day services, and employment. E. How to best support transition age students (school to adulthood). F. Genetic and environmental factors influencing co-occurrence.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>A. Training & Education: There is a significant gap in training and education for professionals working with this population, including teachers, therapists, psychiatrists, law enforcement officers, nurses, and physicians. Updating curriculum and continuing education programs to include information on how to best communicate with, diagnosis, and treat this population is crucial. B. Diagnostic Practices: There is currently greater demand for qualified autism diagnosis providers than there are providers available. Delay in diagnosis can have serious consequences for this population and additional resources are needed to address this issue. C. Hospitals: Current practices often leave individuals without proper care and discharged prematurely from hospitals. Many of the people who experience aggression, self-injurious behavior, or suicidality are heavily sedated and/or confined in restraints instead of provided appropriate supports and treatment. Policies must be implemented to ensure this population receives adequate care. D. Guidance for Parents: Many parents struggle to navigate multiple service systems for their children with co-occurring autism and other conditions. Greater resources for how parents can access services through the lifespan are needed to ensure parents can easily navigate and access services for their children.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Many individuals experienced disruptions in their routines due to the pandemic and are still building new routines or getting back to their pre-pandemic routines. These disruptions have caused social isolation, which has negatively impacted the mental health of many individuals. Furthermore, the pandemic limited access to essential services and therapies, resulting in delayed diagnoses, interventions, and increased/prolonged symptom intensity. Lack of medical care and mental health care, as well as the inability for teachers to observe students in-person, has also decreased identification of symptoms.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>A. Telehealth: Increased access to telehealth has been a significant positive change from the pandemic and has reduced barriers diagnosis and treatment. PAR recommends that the IACC consider looking at ways to protect individual's access to telehealth services including, but not limited to, advocating for the amendment of 42 CFR § 440.90 to allow for greater flexibility of the practitioner's and individual's location. B. Remote Activities: Remote activities have provided flexibility and convenience, but have also decreased face-to-face social interactions, limiting opportunities for individuals to build communication and social skills. C. Program Closures: Many community-based programs that closed during the pandemic are also still closed or are operating at reduced capacity, limiting opportunities for skill development and structured socialization. D. Social Isolation: Disruptions in school, work, and social engagements not only increased social isolation during the pandemic, but also has continued negative effects today. For individuals with tendencies to avoid social situations due to social anxiety, anxiety symptoms have often only increased or intensified after the pandemic.</p>

Name	Ines Echegaray
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The fact that when co-occurring physical health conditions do present themselves, they lead to Autistic Shut Downs that are interpreted as Depression, when they are not Depression. And that leads to worsening shut down and/or health conditions. It's a serious vicious cycle that needs to be addressed.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Again, that Autistic Shut Down is mis-diagnosed as Depression and this leads to ineffective and injurious treatment plans, instead of working with us to address the Autistic Shut Down to begin with...that is the most significant challenge. The general ignorance about this is profound, even in the Medical and Behavioral Communities where we have to seek assistance for our sensory challenges. And then we have to explain to service providers the difference, while we are shut down! It's an impossible situation you're putting us in.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	If I had to choose one among those listed, Communication disabilities are the most challenging for me. Because I am educated, and can advocate for myself with proper preparation, people assume I can always advocate for myself. And I cannot. It takes a lot of emotional and physical energy to self-advocate, and even then, I need processing time to respond to new information. I am consistently required to make decisions on the spot, despite my requesting time to process, all the time. It's profoundly able-ist. I'm also required to engage when I cannot. I have to reschedule appointments all the time, and it's not because of an oversight. It's because some days are too sensorily challenging and impede my ability to engage others.
What additional research is needed to help address co-occurring conditions for autistic people?	Ask Autistic People and not in survey form with time limits. Create something in Praxis that allows us to engage when we can with you, instead of creating an opportunity for us to do on YOUR Time Line. We can't, oftentimes, on anyone else's time line but our own.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the listed options above (Equitable access to and accessibility of services, insurance coverage, service systems improvements, patient provider interactions) would help us. Most imperative is patient-provider interactions being less able-ist and more focused on what we say we need from service providers. And, of course, education, so that others can see us without our having to explain ourselves, which we often cannot do.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Slow COVID has made an impact, and worsened an already challenging ability to respond. I am slower and I have fewer resources to call upon. And when I ask for help from my medical provider, I am dismissed.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	Disruptions of service and reduced in-person social interactions continue to affect us even after the pandemic. We have yet to recover from the Mental Health impacts. And while some services have increased, it is still very difficult for those of us who were diagnosed as adults to receive supports and services.

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Irene Tanzman, parent/guardian
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I am the almost 70-year-old mother and guardian of a thirty-five-year-old man named Isaac, diagnosed with severe autism, intellectual disability, and Crohn's disease. Isaac's individual support plan (ISP) and his Home and Community-Based group home placement is not adequate to support Isaac's needs and keep him safe. This is particularly true in terms of accommodating his inflammatory bowel condition, a serious and chronic problem. His plan does not include a clinical assessment which explores his medical needs. The Massachusetts Department of Developmental Services has been aware of Isaac's issues but sees no need to address these. Isaac is also at high risk of developing colon cancer due to family history on both sides of his family and because of his inflammatory bowel disease diagnosis. Isaac's Home and Community Based placement does not have the health services essential for addressing his special health care needs. There is currently no plan in place for his need for regular colonoscopies. When I am no longer able to prepare him for colonoscopies, there is nobody with the expertise to do this in his current programming.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There is no plan in place to discern a Crohn's flare from a psychiatric or behavioral issue.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Isaac cannot describe pain or tell a physician where it hurts. This is also one of the many reasons that speech and communication interventions are an essential accommodation for him. The community-based placements available to him do not offer speech and communication therapy or communication therapy based on the behavioral principles of verbal behavior. They do not have a mechanism or a plan for upkeep of augmentative communication devices. No allied health professionals are involved with his individual support plan development or were present at this or any of his thirteen ISP meetings. No nursing staff has ever been involved with Isaac's ISP development or present at any meeting. I have never received any nursing or medical evaluation from anyone at his Home and Community-Based group home placement.
What additional research is needed to help address co-occurring conditions for autistic people?	Research whether community-based placement are adequately addressing special healthcare needs.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Give families a choice of service models. Expand and offer public intermediate care facilities (ICF) to families who need this.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Izabella Pulvermacher, Dental Coordinator Department of Developmental Services
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	When discussing co-occurring conditions and autism most agencies forget oral health. There must be programs that address oral health for individuals with autism,
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Oral health - dental care is omitted....
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities - not able to communicate pain....
What additional research is needed to help address co-occurring conditions for autistic people?	We need to create space where all specialties work together to accommodate proper medical and dental care
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Supports need to start when they are young and build on successes and not to wait until the person is an adult. Also, children with autism become adults with autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	J Maust, HUB 302
Demographic	Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances, sensory & motor challenges, diabetes, GI issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, bipolar, schizoaffective, ADHD, suicidality, frontal lobe dysrhythmia
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities, medication balancing & dosing, impulsivity, certain areas intellectual disabilities,
What additional research is needed to help address co-occurring conditions for autistic people?	The medication game of balances of dosages & kinds when involving several co-morbidities. How to control the anxiety & thus control the ability to respond to a situation instead of spiraling. How independence may be achieved using technological aspects which calm anxiety. Beneficial in-patient & availability. How addressing social & physical needs lessens emotional disorder distress. Best job settings, if any.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Patient provider services (esp upon death of primary caregiver), service system issues, Life-skills needed for the comorbidity issues, many types of medications, get rid of Paratransit for some & give a car service to cut down on anxiety, nursing
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The good lasting impact is availability of mental providers' telehealth. It aids in assuring appointment will be kept. No need to figure out transport.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive is availability of telehealth , ability with zoom to now connect in a much broader way.

Name	J Olson
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Co-occurring physical health conditions exacerbate Autistic/sensory challenges and affect every aspect of the child's life. A major lack of understanding and acceptance, particularly in the educational setting. People are not understanding of what they can't see and have the mindset that the challenges caused by these co-occurring health conditions are willful and purposeful because they are not always apparent.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Again, lack of understanding and acceptance. Particularly in the educational setting. Watching your Autistic child have panic attacks every morning because they are petrified to go to school and become so depressed that they question their own worth because when they go to school they are taught that everything they know, think, feel, do, are is wrong is an all consuming feeling of helplessness and soul-crushing as a parent.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Understanding and acceptance. Autism is a dynamic disability. People do not understand this. They do not understand why an Autistic person may communicate verbally one day, but be unable to communicate verbally and need to utilize sign language, gestures or a communication device another. It is viewed as willful and purposeful manipulation (actual terminology noted in my child's educational file).
What additional research is needed to help address co-occurring conditions for autistic people?	Research is desperately needed for the PDA (Pathological Demand Avoidance) group of Autistic individuals. Both adults, but especially adolescents. Students are being mislabeled as willfully defiant, behaviorally challenged, socially ostracized, discriminated against, and being deprived of the right to a free and appropriate public education in the least restrictive environment because of a lack of understanding and unwillingness to work through the challenges that PDA Autistic students face. PDA is widely recognized and diagnosable (therefore able to be supported) in other countries, but not in the USA.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Accessibility and access to services and supports. Increased understanding, awareness and acceptance of these co-occurring conditions. Parents have to go on a wild goose chase to find what their child needs. Services and supports that are backed by Autistic individuals, and not traumatic to Autistic individuals like ABA therapy. Not a one size fits all support plan for all Autistic individuals. Neurodiversity affirming supports and services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Increased acceptance of remote work/school has been both a positive and a negative. It allows parents to better support their child at home when need be (so long as the school is willing to work with the family), but it also exacerbates a lack of social interaction.

in-person social interactions and obligations)	
--	--

Name	Jack Brownn
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances, Visual Snow Syndrome, Sensory Issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, BPD, Depersonalization
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Dyslexia, Stuttering
What additional research is needed to help address co-occurring conditions for autistic people?	Research those who are also self-diagnosed autistic
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Restricted access to services due to diagnosis.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My asthma has worsened
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Wearing masks is very hard to manage. The sensory sensitivity makes it difficult to wear them although they are a line of defense against COVID.

Name	Jackie
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Workplaces are not equipped to accommodate autistic individuals in most cases. Disability is hard to get so most of us end up working jobs that severely overestimate us and lead to melt/shut downs. These episodes are unpleasant and exhausting, for me personally it's affected my depression and anxiety negatively. I've also had to call out a lot due to the reasons above.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My depression makes it hard for me to clean, take care of myself, eat. My anxiety makes it hard to sleep and do things outside my house. My adhd craves structure and balance but everything is out of whack because I haven't been able to clean or get things done like I need to. I get overestimated by all the tasks and chores I have to do, sometimes causing a melt/shut down, not to mention the daily normal stressors the average adult has like affording rent, food, and bills.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication is the most difficult as most places of employment are not willing to make adjustments in Communication methods so that the autistic person can fully understand what is expected of them. Many of us experience a heightened reaction to being in trouble or doing something wrong and being criticized. Getting an official diagnosis is almost impossible as an adult thus making it even harder to get services and accommodations.
What additional research is needed to help address co-occurring conditions for autistic people?	Research in adult females or AFAB people, people of color. The connection between hypermobility and ASD, whether there is a link to Ehlers Danlos Syndrome
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Education on effective communication methods, understanding when a shutdown or meltdown occur it IS NOT the autistic person throwing a tantrum. Access to disability for autistic adults and improved access to pathways to get an official diagnosis as an adult.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruption in services, isolation. It's lead to some skill regressions and then to be thrown right back into society like nothing has changed has been very triggering and scary.

Name	Jackie Ceonzo, Parent
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep deprivation I believe causes so many other challenges with autism. I feel it exacerbates all the other issues- certainly can make epilepsy worse, no one has a good day when they have not slept. The other big issue with sleep issues is this affects everyone caring for the person also. An exhausted caregiver can't really do their best. I often say to people let's deal with the sleep issue first and then we can deal with everything else.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression and self injury are the most isolating for our family and the most challenging to deal with kids I have worked with - it makes your world so small. As kids age so do their parents and when you reach the point that they can physically hurt you it becomes such an unmanageable situation so quickly. Self injury is heartbreaking - to see my son bite his wrist til he bleeds, or kids hit themselves, especially when the hospitals are not really equipped to deal with treating the individual so most kids are probably over medicated to avoid an outburst. With these two issues it becomes very hard to be in the community - programs won't take them so we have all folks suffering at home with too few capable psychiatrists trying to manage the behaviors with trial and error medications. It's awful and there are way too many people living like this and they afraid to talk about it.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	These just add to the issues and make caring for these individuals without tremendous support impossible. My son has epilepsy, I/DD, aggression, self injury, Mood disorder, non verbal he's 28 and we are 60 - we live one crisis away from it all falling apart every day and the future - biggest fear. The I/DD component makes all the other issues so much more complex - he has no sense of danger, can't communicate his needs, make for a very complex plan.
What additional research is needed to help address co-occurring conditions for autistic people?	The seizure component and gut component need to be part of the screening process upon diagnosis We need more medications with less side effects especially weight gain We need best practice for caring for these individuals - this caring for those with aggression should be trained to handle it like professionals are We need more settings where care can be administered and monitored to many people are handling these issues at home and doctors don't have a clear picture of what's happening with meds prescribed etc. We need places for these guys to live and be cared for because too many are affected and I dare say won't be cured.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need treatment facilities covered by Medicaid. We need dental care with sedation. Dental issues are cause of many behavior problems. We need better meds and better oversight and distribution. We need quality day and residential programming to flourish with funded by self directed Medicaid. We need a professionally trained workforce to care for these guys in community settings most appropriate to their needs.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The pandemic was devastating - the little we had is still disrupted - so much regression occurred for so many - lost caregivers, loss of routine, setback in future planning, inability to return to volunteer or work program. Progress lost - hard to know with my son as he doesn't talk but he is not the same post Covid none of us are
What lasting positive or negative impacts have societal changes due to	Telehealth is a major plus in some cases it exposed so many flaws in a very frail service delivery system - the system is now officially broken but it's an

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

opportunity to fix it. I say to many - now that everyone has had to isolate they have an idea of what life living with a profoundly autistic person is like - we never go anywhere crowded - we are home more than not - it was hard to believe our world could be any smaller Many of our guys like my son did not do well with virtual stuff but many did.

Name	Jaime
Demographic	Family member of an autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Sensory and motor Challenges for my child. He doesn't sense things as a normal child and he lacks the normal motor abilities of a normal child. For instance: Myself and wife have struggled since his early childhood to assist him to illustrate him to objects and physically point his head into the correct direction of things as he's constantly looking up in to the empty air, directing him while he's walking as his attention is limited and he is constantly looking up, playing with his hands or looks back as he walks and is constantly stumbling. We have struggled teaching him over and over how to hold on to a spoon, difficulties in getting him to sit still when is time to eat, teaching him how to hold a pen in school, making him to pay attention to teachers-to boards- or screens. Difficulties to get dressed as he's 5 and I still have to help him dress and he doesn't distinguish a right side from wrong side, constantly and countless trips to the bathroom potty training him which has turned to be one of two most difficult tasks so far as well as getting him to talk or communicate as he has a short attention span and it is hard for him to pronounce many words. This is not only a difficult challenge but an endless mission which doesn't have an end date to be completed. The challenges are countless and constant.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Anxiety, attention-deficit and hyperactivity in our child brings significant challenges. His anxiety drives him to clap his hands in an unstoppable manner and endless and sometimes as he sleeps his hands seem to move causing him to be restless and sleepy at school. His attention-deficit has brought him many challenges at school as he tends to direct his attention anywhere but the things he's supposed to be learning. He is a very smart child but his lack of attention distracts him from his full learning capacity and delays his learning and this retreats him from being at the same learning level from a normal child his age. He has to have a special individual education plan developed specifically for his needs and sometimes the resources are limited and the specialized parties are limited in some schools and this arises challenges to communities that deal with the spectrum. He is also very hyperactive and there have been reports from school where he climbs chairs/desks and jumps and runs in the class. He is always so hyper at home and he climbs objects which is dangerous as he has fallen a couple times and is a constant vigilance we have to put up with every single day and is time and energy consuming. Is hard to visit places and have quality family time as he can't endure long waiting times. We have limited places we can visit and we always have to choose nearby locations since he can't sit for long periods of time inside a car.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>His learning is very periodic and delayed. He faces constant learning struggles which seem to take a toll and frustrate him causing irritation periods and periods of isolation and bringing swing moods. He is developing at a much slower pace than other normal kids and we see the differences between him at five years and our child being only four and we can see the huge differences in both of their developmental stages. The communication portion has been so difficult and is hard for him to express what he wants and it's hard for us to know or identify his needs and this also provokes his tantrums and mood changes. There are times when out of the blues he starts crying and is hard to understand what causes these reactions. This brings sadness and disappointment to me and my wife and we feel helpless and feel that as much as we want to help him there's just things we won't be able to do for him.</p>

<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Full extent research needs to be done on two things: Research needs to be done on how these conditions can be prevented before birth and if the conditions can't prevented before birth: Research needs to be done on the possibility to eradicate these conditions once they appear. The biggest challenge us families with a family member in the spectrum have to face is being heard and agencies understanding this is a real critical condition affecting our nature, our surroundings and poses many obstacles to the family's and child's well being. The families dealing with a family member in the spectrum are constantly questing for answers to our questions as to how does this happen and when it happens how can these conditions be eradicated. Team-work makes the dream-work and I'm sure all agencies working together is crucial to develop the powerful component that will identify a real live solution to the problem rather than just an ongoing treatment. Now that these conditions have spun in such incredible high numbers and many important agencies are finally realizing and accepting - I'm sure the correct intelligent minds working together will be able to focus and identify great techniques to help make these conditions minor, almost seamless or even eradicated. My child needs it and I'm almost positive the cure is already working it's way through!</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>More clinics, centers need to be facilitated. More educational programs on the issue. More personnel need to be capacitated to be able to provide spectrum services . More schools with special intelligence should be built for kids on the spectrum so families don't have to travel long distances to find these services. More equipment and tools need to be developed. Reliable and reduced means of transportation for all families assisting with the education of a child on the spectrum. More economic assistance/resources need to be made available to the families or to the child alone as soon as there is a disability diagnostic. The sooner any child in the spectrum has access to these benefits would be crucial to the child's well being.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Covid caused more anxiety and more frequent allergic conditions. I perceive more anxiety in my child after enduring such long periods of time being enclosed at home. Post covid also brought more constant allergic reactions in my child's health not perceived prior to covid.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Disruptions in crucial services. Scheduling conflicts with doctor visits. Limited availability to live personnel and the increased reliability to remote resources.</p>

Name	James V. Bradley
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Clumsiness, sensitivity to light and sound, difficulty becoming physically comfortable, nausea from gastrointestinal discomfort.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Major depression, severe social anxiety, ADHD (combined type: both inattentive and hyperactivity), suicidality.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	It is difficult for me to communicate and express myself verbally; I do not organize my thoughts in a way that can be easily conveyed in a real-time back-and-forth conversation.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to and availability of services: housing, food, and health care without being limited to a geographical location, the lack of government-issued identification, or length of employment. A lack of the aforementioned items does not mitigate the need to have a safe place to live, food to eat, and health care.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	James Weingardt
Demographic	Autistic individual; Family member of an autistic individual; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory motor preferences and differences are grossly not understood especially by school and medical personnel outside of sensory based occupational or vision therapy. Gastrointestinal disorders are not understood by general practitioners. Referral to specialist with emphasis on gasterolintestinal is rarely given. Slipped disk from not knowing boundaries or pushing self to limit/dangerous behaviors leads to obesity or heart disease.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, self injurious behavior, aggression, suicidality, chronic traumatic encephalopathy, wellbeing, happiness, rejection sensitivity dysphoria, flourishing, social inclusion without masking,
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Sensory processing, developmental disabilities, neurological functioning (dysgraphia, dyslexia, dyscalculia, spikey profile), executive functioning (remembering, planning,), rejection sensitivity dysphoria, Trauma, complex trauma,
What additional research is needed to help address co-occurring conditions for autistic people?	nonspeaking, minimally speaking or unreliable speaking individuals are ignored or projected onto, discriminated against when not taught to advocate effectively for self. Study on reduced anxiety and depression by using Ayers Sensory Integration or other neurofeedback approaches during emotionally exhausted or traumatic times. autistic youth or adults whom grew up in an alcoholic family or in a family where they are systematically not listened to. stigma of autism vs neurodiversity. Study of neurodiversity models from autistic community, neurodiversity model shaped by typically developing professionals and community members with consultation of neurodiversity individuals (IE Boulder Valley School District may pass 1st (known to me) neurodiversity policy in the nation. Further studies expanding sample size, etc: A Sensory Integration Intervention in the School Setting to Support Performance and Participation: A Multiple-Baseline Study how to implement Ayers Sensory Integration Intervention on a larger scale at the state and district levels. Study on using Ayers Sensory Integration for children 0-3 yrs old, 9-13 yrs old, 14-21 yrs old, adult and geriatric populations.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	School based education of peers of autism, nuerodiversity, functioning including randomness and noise in joints Autism, Micromovement approach (Torres et al 2013). Training people how to respond with non-speaking, minimally speaking and unreliable speaking individuals rather than "he/she didn't tell me" Behaviorism trauma due to increased understanding of physiology and the polyvagal theory. Youth sports how untrained coaches often parents and organizing bodies do not understand early childhood development and how youth sports system systematically excludes autistic children based on perceptions of behavior vs physiology as well as limit setting. stadiums, concerts and events can be more neurodiversity friendly including entry into parks, low lines or crowds, trained staff or an independent neurodiversity entrance. Difficulty getting needs addressed

	<p>due to unreliable speech in the short 15 min window. providing sense of safety and assurance that what is said will be further looked at with provider and that they don't get to decide whether they will listen or not to us including recommendations for specialists.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Societal interactions have been less. Raise in obesity. unknown increased anxiety and depression or suicidality</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Increased use of computers, reduced sleep.</p>

Name	Jamie Cullen, Parent
Demographic	Family member of an autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>My son has autism and other commorbidities that makes it impossible for him to email you, speak at a conference and get his needs met without 24/7 help. When Aspergers was taken out of the DSM is when things became progressively worse for people with severe and profound autism who will NEVER attend Harvard. Please do not minimize my son by saying to me "how do I know that he cannot attend Harvard". He has global developmental delay and needs 24/7 care. He is 21 years old and still needs help with daily living needs, will elope with no safety awareness and has been hospitalized without proper healthcare his entire life. When we lived in Minnesota we had to travel to Prairie St. John Hospital in North Dakota for sub par care. Now living in Illinois we have had to go to Indiana where our son lost over 50 pounds in 3 weeks and at discharge the nurse asked us what medication to give him? What? We had left a full page list on what to do and what foods he will eat and even bought the foods and told them about his restricted diet. His needs were once again not met. We had to get an attorney to get him appropriate education and in the least restrictive environment for him after he ran away from a licensed school and was lost in the same month the Heartspring School had a death of an autistic adult student due to elopement. Please we need knowledgeable medical Doctors, services and housing.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>My son will hit his eyes until they are swollen shut. He elopes into traffic, water and has no awareness of safety. He cannot talk other than Bathroom Please and short needs. He will become so aggressive we have been sued by school staff who personally sued us while he was at school when the behavior happened. We have had to hospitalize him since the age of 5 and have tried every other therapy and service we have known about with no success. We need knowledgeable Doctors, more help for adults for housing and services because when they graduate their needs do not change and they still need to learn. My son has autism and other commorbidities that makes it impossible for him to email you, speak at a conference and get his needs met without 24/7 help. When Aspergers was taken out of the DSM is when things became progressively worse for my son who will NEVER attend Harvard. Please do not minimize my son by saying to me "how do I know that he cannot attend Harvard". He has global developmental delay and needs 24/7 care. I will be his voice as long as he is not treated in the way that is humane. He was restrained in a Hospital for over 3 months. Please do not forget about the adults who are not attending Harvard and never will. Please remember EVERYONE is important. The best compliment I received in my life was the fact that I never treated my special needs son any different than my other 2 boys. I have fought long battles for him and fought law suits. I have watched him hit his eyes until they were swollen shut and he had to be restrained in a Hospital.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>My son cannot talk and tell people who he is, what is wrong and what his needs are. People may not know that if he runs into traffic he has no awareness to safety. The staff that work with him are not paid enough. He cannot live without 24/7 care. He rarely sleeps through the night. I could go on and on. I have a son with autism and other co-morbidities and I am his voice. He cannot advocate for himself but that does not mean he is less than and his needs shouldn't be considered. When the DSM was changed and Aspergers was taken out of the diagnostic manual is when my son and all of his friends lost their spot at the table. To consider my son in the same</p>

	<p>category as a student who can attend Harvard is the most gross discrimination there is. The levels in the manual have not changed the fact that #actually autistics are trying to lead any and all discussion to say I shouldn't speak for my son. If I don't who will. He cannot and would not be able to text, send an email, etc. That does not mean I treat him differently and in fact one the the best compliments I received in my life was how I didn't raise my son any differently than I did my other 2 boys. I have a degree in Social Work and I am a fierce advocate for anyone that doesn't have a voice or doesn't know how to use their voice to make changes.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>We need to find out why aggressive behaviors occur. What will medically help our kids so they do not hit their eyes or bite their skin until it is bloody. I was walking near my Dad's farm in South Dakota. I saw a bright green piece of corn and brought it to a farmer and asked what it was. They said it was the pesticide that is put around each piece of corn so it kills worms that attack it. These pesticides are in our ground, food and water. Is this causing our kids to have autism and co-morbid conditions? What is this doing to all of us? Is this causing cancer. We need to start researching all of these terrible things that no one realizes is going on and causing so many issues.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Doctors with the knowledge of how to help. More Hospitals that can care for individuals who need both psychiatric care and health care. People to be paid better so we have more housing and care for our kids. I had to quit my job to find long term care for him and I have to move to a state in order to find that care which is away from the family and friends that have helped us throughout our lives. These are the decisions I make because this country is not waking up to the fact that in 2002 1 in 150 babies were born with autism and now the CDC predicts in 20 years 1 in 3 babies born will have autism and half of them with other comorbidities. What will happen when all there people needing services cannot get them and there is no now able to help. We need help now, We cannot continue to wait while our kids are in hospitals that do not understand how to care for them so they are restrained? What are you doing now to help all these individuals?</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>My son lived at home until covid. He became so adisregulated because he didn't understand that he was hospitalized for 3 months restrained to a bed with the State Crisis Team telling us to keep him in the Hospital so he is first to get Transition Housing, That Housing never came and we had to place our son who does not speak in an Illinois State Approved residential School that was not appropriate for him because we had no other options. He eloped from the school and this is when Heartstring School had a student death due to elopement so the school kicked our son out after losing him and we had to get an attorney to get him into a school in New York. We had to send our already challenged limited speaking child out of State to a school and drop him off and go back to Illinois. I had to quit my job to find someone who would help get him back to Illinois. In the 2 years I have searched I found 1 place in Wisconsin willing to take him. We are having to move to Wisconsin for help. It's insane and I am thankful we can afford to do this but what about all the people who can't??</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,</p>	<p>We have no workers to help care for our kids and governments do not seem to grasp the need and complete desperation of our families.</p>

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Jamin Johnson
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Significant challenges with co-occurring physical health conditions: depression lack of interest in speaking more than 1-3 words sound sensitivity Biggest challenge with co-occurring conditions-- a. finding doctors who know anything about serving our kids/adults with these challenges. b. finding doctors willing to serve our population
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression anger self-injury ADD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Challenges-- all of the above-- learning, developmental, intellectual, and communication disabilities.
What additional research is needed to help address co-occurring conditions for autistic people?	YES... an it needs have on-going funding!!!! Band-Aids are not going to help the 1 out of 6 kids with autism and co-occurring conditions. We need more research and support!
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better pay for support providers-- the agencies take the dollars and pay the staff what they can, but they have to hire anyone willing to work with our challenging family members. So, we get unskilled, bidding their time, workers that turn over ALL THE TIME! Training and \$upport to doctors willing and able to work with our kids/adults with challenges to find solutions.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	NA-- my daughter didn't get Covid! YAY!
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	NA

Name	Jana Young
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	PDA, Anxiety, sensory
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA & ADHD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication challenges, emotional dysregulation, learning difficulties (literacy)
What additional research is needed to help address co-occurring conditions for autistic people?	PDA! It's so hard navigating support for my PDA autistic son with ADHD ... especially as PDA is not in the DSM yet so it's discounted as a contributing factor by his doctors, and ADHD is not given support in our school system, so he's faking through the cracks in both public institutions.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Acknowledgment that PDA is real and legitimate
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Massive increase in childhood anxiety, particularly in my son's grade 2 cohort... the number of neurodivergent diagnoses at his school ballooned for his age group, which started kindergarten during the pandemic

Name	Jane Horn
Demographic	Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Echolalia is a significant barrier to communication for many autistic children. It is not unique to autism, but often alerts providers that the problem may be autism.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For the child who uses echolalic speech, there is often great frustration that his/her speech is not understood. It is very frustrating for parents and caregivers.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Most education is very difficult with a child whose language is severely echolalic.
What additional research is needed to help address co-occurring conditions for autistic people?	Research is needed to understand what is going on with a child who only speaks in irrelevant phrases. When a child speaks clearly, words that he/she has heard, but do not fit the present situation, the problem is not hearing. Does this child have any comprehension of the words he/she speaks?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I know examples of very early speech therapy getting a child past echolalia. Too often, speech therapy is not available until a pattern of echolalia is established. Research on what treatment, and how early is needed. Parents have too often been told "let's wait and see." Referrals and treatment are too late. Sometimes parents wait for YEARS for waivers or vouchers to come through. If early intervention is to work, providers need to know about it, and parents need to be guided to the resources EARLY.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jane Roberts, University of South Carolina
Demographic	Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Anxiety is an early emerging feature that has significant negative effects on these children, their families and the communities that support them. Intellectual impairment (ID) is a huge factor that constrains all areas of function, and sensory issues are pervasive.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	early and valid diagnoses are a huge challenge as diagnostic overshadowing can result in delayed or invalid determination (mistake fear and anxiety for autism features). Anxiety will effect employment, academic achievement and social competence.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	lack of functional independence, poor services in school or communities and the need for housing. transitioning to adulthood is a tremendous challenge for those with ASD who have co-occurring conditions.
What additional research is needed to help address co-occurring conditions for autistic people?	sex effects in anxiety, brain based and ANS function as potential bio behavioral mechanisms.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	integrated care particularly in rural areas,
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jane Seymour
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator

What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological Demand Avoidance profilr
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Understanding Pathological Demand Avoidance
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for treatments such as neurofeedback therapy, more mental health coverage, respite support, educational support when the child can't be in a public school
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jane, County AE
Demographic	Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The individuals that have a diagnosis of Autism with higher IQs and open in ID ODP waivers, providers are struggling to support these individuals in our current service system with Individuals diagnosed with ID. Some of these individuals have severe mental health issues and are not wanting to be supported in the MH system because of their Autism diagnosis.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	It's not those individuals that providers struggle to support, it's the Autism only individuals with the high IQ's. Are system is based on supporting individuals with an intellectual disability. Question is are we stifling the individuals with Autism with normal to higher IQ's to their full potential.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The individuals that have a diagnosis of Autism with higher IQs and open in ID ODP waivers, providers are struggling to support these individuals in our current service system with Individuals diagnosed with ID. Some of these individuals have severe mental health issues and are not wanting to be supported in the MH system because of their Autism diagnosis.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Janet Callahan
Demographic	Autistic individual; Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Doctors often refuse to look for reasons other than autism. For example, we have heard, "well, all autistic kids have X, so there is no solution" even though there are known treatments and other possible causes for X that are being ignored.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	It is <i>*extremely*</i> challenging to find appropriate mental health care at all, especially for children in our state. Finding any mental health professional willing to work with an autistic child, much less anyone who actually knows how to do so effectively, is nearly impossible. It took 5 years to find a therapist to see one of my children who has severe anxiety, presumed PTSD, ADHD, probable OCD, and self-injurious behavior. My children's psychiatrist, who it took over a year to find, no longer accepts any insurance; my children's medicaid case worker told us they cannot provide a referral because the medicaid provider wait lists are too long. There is no facility in our state who will take inpatient mental health clients who are autistic or have other medical issues. So...if we cannot manage my daughter's needs at home, there is no other option.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	First, people's assumptions that any of these things mean that someone is incapable of learning has been a bigger impediment to my children's learning than their actual diagnoses. My children had IEPs (we currently homeschool because there is no reasonable way to send them back to school and get what they need). Their IEPs did not result in academic progress, even though they were quite capable of it. We spent hundreds of hours negotiating how to get needed services and supports. My son has substantial communication disabilities. We were told when he was in 4th grade that he would not graduate from high school. In part, he could not participate in foreign language classes, because he couldn't "speak English," and those foreign language credits are a graduation requirement. At home he's learning a 2nd language quite successfully.
What additional research is needed to help address co-occurring conditions for autistic people?	Research is needed to first prove that medical and educational and mental health professionals are ignoring all these things and that they should be treated. Research is also needed to sort out how much of these things are "just autism" vs actual conditions that could be resolved, and thus might improve people's lives and outcomes. The list of co-occurring conditions is long, but professionals often don't know the list is as long as it is.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to mental health treatment is a problem for everyone, but autism makes it even less equitable. Insurance companies need to stop saying "well they're autistic so this won't benefit them." Providers need to stop assuming that something is "just autism."
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It has made it worse for many people. Fewer supports exist now than pre-covid. It took us 2 years to hire someone to cover my children's state-approved support hours because so many caregivers left the field due to covid. They were not provided appropriate educational supports for virtual learning during covid, and lost ground. They were not offered any additional

	<p>services when things started to return to normal. And because of their medical histories (all those co-occurring conditions), their medical providers did not feel returning to in-person school was a viable option. They lost out on things that were assisting their mental and physical health when things were locked down, and getting therapies back on track has been challenging.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Disrupted services have not been un-disrupted, which is a problem. Virtual schooling is not good for everyone, nor are telehealth appointments. Increased remote work has been good for me as an autistic adult. It's been good for my kids because I am here and can step in when things are not going well no matter what time of day it is. On the whole, though, I think it's mostly been negative.</p>

Name	Janet Shouse
Demographic	Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Many individuals on the autism spectrum have physical health conditions that cause pain and distress to themselves and their families. These include significant sleep disturbances, seizures, gastrointestinal conditions such as constant constipation, chronic diarrhea, and reflux, feeding issues and food aversions/restrictions, sensory hypo- and hypersensitivities, and catatonia. These physical health conditions negatively impact the quality of life for the individual and their families. In some cases, these conditions lead to premature death.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Among those with intellectual disability and limited communicative abilities, aggression, self-injury, elopement, pica, and property destruction are often present. Every year multiple children with autism wander from home and drown. Less dire, but much more frequent consequences are bruises, cuts, skin infections, and broken bones for the individual and often their parents, siblings, and support staff. Repeated self-injury can cause detached retinas and concussions. Pica causes individuals to ingest all types of inedible objects. Such behavior can require emergency medical care, surgeries, and costly hospital stays, and often these individuals require extraordinary measures to ensure that they adhere to treatment plans and can heal. Such conditions also often lead to out-of-home placements, as most families don't receive the needed supports to keep their loved ones at home. Among those with higher cognitive abilities and fewer communication issues, anxiety, depression, obsessive-compulsive disorder, ADHD, and suicidality are found at much higher rates than the general population, yet effective treatments and counseling are extremely short supply. Not only are these conditions traumatic for the individual, the family, and support persons, they often impose enormous costs on families and ill-equipped systems of care. Reducing the frequency and intensity of these mental and behavioral health conditions should be a key goal for autism treatment and research.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For approximately 30% to 40% of individuals on the autism spectrum who have severe communication impairments and intellectual disability, they often require near-constant supervision, which means one parent may have to quit work and stay at home, if the child or adult is still in the family home, or a paid staffer is needed around the clock, if the person is living outside the family home. Such an individual is unlikely to be able to live independently nor to earn enough to pay for their own housing and upkeep. Families often face huge financial costs—the possible loss of a parent's income as well as costs for multiple types of therapy, respite care, in-home supports, specialized equipment, medical care, and often replacing or repairing property destruction. And state Medicaid waiver programs often have huge waiting lists, limited funding, and chronic and severe staffing shortages preventing such adults from being able to move out of their family home and to be as "independent" as it is possible for them to be. Also, since Medicaid dollars cannot be used for housing, a huge challenge is for these individuals is being able to afford decent housing on an SSI check of \$943 a month, particularly if the individual's behavioral needs require the person to live by themselves (with 24/7 staff).
What additional research is needed to help address co-occurring conditions for autistic people?	A top research priority for those with the most significant impairments should be the alleviation of aggression, self-injury, pica, and elopement. There are seemingly very few truly effective medical and behavioral treatments, and we need research into ways to prevent, if possible, these behavioral health conditions. We need more research on effective

	<p>medications, cannabis, electro-convulsive therapy, and behavioral/sensory approaches. We also need research into effective counseling and talk/play therapy for those with significant communication limitations. We need a greater emphasis on the needs of adults who often lack access to appropriate care—both mental/behavioral health and physical health—and whose distressing and dangerous behaviors cause great trauma for the individual, their families, support persons and other care providers. For those with higher cognitive abilities and fewer communication issues, more research is needed for effective treatments, including medications, for anxiety, depression, and OCD, so individuals won't have to face multiple medication trials to find one that works well. We need hospitals—both primary hospitals and psychiatric hospitals—to be accommodating to the needs of autistic adults who have medical complexities, intense sensory needs, and/or intellectual disability. Too often autistic individuals with ID or co-morbid medical conditions are not accepted by hospitals or stays create trauma for the individual.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Insurance, both private and public, should cover both outpatient and inpatient care for those behavioral health conditions associated with individuals with the most significant impairments. Medicaid reimbursement should cover the costs of treatment, so that health care providers are willing to accept Medicaid recipients, particularly adults. Treatments for such behavioral health conditions must be recognized as medically necessary under mental health parity. Currently finding willing and knowledgeable health care providers for this population is extremely difficult. There are vast “health care deserts” across the nation for this rapidly growing population. For many people, there are no in-state options for a teen or an adult with autism, intellectual disability, and severe behavioral health conditions. Families struggle to find and fund distant hospital stays for loved ones who may not be able to communicate except in person. We need an intense effort to educate health care providers on the needs of individuals with autism across the spectrum. Medicaid waivers should be portable, so that families can move to another state without a child or adult losing their supports and services or having to go to the bottom of a years-long waiting list. Medicaid and other funding should enhance payments for supporting and serving those 30%-40% of autistic individuals with the most significant challenges. Enhanced funding is vital for waiver providers as well as health care providers.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Given how long COVID manifests itself in multiple ways, it's extremely difficult to know the impact on those with autism who are not able to communicate effectively or to articulate their internal states. The mental and behavioral health impact of the pandemic itself was distressing to large numbers of autistic individuals. We do know that COVID-19 was far deadlier for individuals with intellectual and developmental disabilities than any other group. Additional research in those areas is needed.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced</p>	<p>The COVID shutdown has had a devastating impact on programs serving individuals with autism and intellectual disability. Many programs were unable to keep staff during the pandemic and closed their doors, leaving many adults isolated with little or no access to day services or community engagement. An already severe shortage of direct support professionals has become even more dire, and many individuals who ostensibly have waiver supports cannot get those supports because there simply are no DSPs or personal assistants or job coaches to provide those services. This is sometimes referred to the “shadow wait list,” as these people are enrolled in</p>

in-person social interactions and obligations)

waiver programs, but they aren't being served. While the increased use of remote work has helped some autistic individuals and their families, for many families, remote school was a nightmare, and their children lost enormous ground. The disruptions to child care programs, and now the loss of pandemic funding to help stabilize them, has exacerbated the huge issue of finding appropriate child care for autistic children and teens for working families. The federal government should take action to facilitate the use of telehealth across state lines. At this time, many areas are not served by autism specialists, and telehealth can provide access to many more people. However, while many autistic individuals can benefit from telehealth, for many others, virtual options simply do not work, and telehealth cannot be seen as a panacea.

Name	Janice
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I would say motor skills and joint pain
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is the most for my daughter
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My daughter is very smart but often has trouble finding the right words. Expressive verbal skills have a problem since she was a preschooler. She can function in the world and has a job but sometimes it takes a little bit to get context and details on things she's talking about
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better insurance coverage. It seems like all the psychologists and psychiatrists who don't accept insurance are the best and the ones who do are subpar
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My daughter has gotten Covid twice (she works in an after school care program) but I don't see any long lasting issues.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote college classes have been a good thing for her. It decreases the anxiety and since she doesn't drive requires less coordination to get her there. However she does better with the structure of a zoom class vs pure online go at your own pace class.

Name	Janice, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My daughter did not sleep well even as an infant. Could not nap, difficulty falling asleep, frequent stomach aches.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression and anxiety were diagnosed at age 13, but adhd and autism were not identified until she was 25.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	She is very intelligent but easily overwhelmed by noise, crowds, etc. Which may cause temporary inability to speak.
What additional research is needed to help address co-occurring conditions for autistic people?	Early screening and diagnosis for girls, how to create sensory friendly environments.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Financial assistance for autistic individuals to access appropriate medical care, including physicians and disability resources.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The availability of telehealth has been helpful.

Name	Jared Goodrich
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory Issues with crowds.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have ADHD, I have social anxiety etc it can be difficult but manage.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Social interaction
What additional research is needed to help address co-occurring conditions for autistic people?	Understandings
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Treat us like any other individuals.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Stress
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth has been so useful

Name	Jason B, Self
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep, sensory, gastrointestinal, diabetes, eating / nutrition / weight, stress, lack of physical activity.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Burnout, depression, anxiety, meltdowns, suicide, sleep deprivation, sensory triggering, can't leave house / interact socially.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication, learning things a different way, non-accommodation for outliers in just about every facet of life.
What additional research is needed to help address co-occurring conditions for autistic people?	Research burnout, shutdown, PDA, depression, anxiety. Research how to support adults who disconnect from society. Research support for untreated chronic medical problems due to communication issues and resources. Research how to help adults with daily tasks like meals, chores, maintenance, etc. Research how to provide jobs that accommodate autistic people. Research how to fight exploitation of autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Outreach programs, autistic communication specialist that can "translate" for medical staff, affordable direct services or insurance, accessibility for people with sensory and social issues, being patient and providing accommodations, resources / staffing, not waiting six months for an appointment!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Since the pandemic I can't leave my house most days and don't interact socially. I do live with my autistic partner, we are in our 40s. We have little support for chronic medical issues due to communication issues, depression, anxiety, burnout. We both lost our jobs and are unable to function. We struggle to do many daily tasks like meals, chores, basic shopping, maintenance, etc. These things are not due to severe financial issues, we just can't face the world and are in severe burnout. We started having issues like this in our late 30s but the pandemic made it so much worse.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Deaths, changes at work and then layoffs, refusal and reversal of accommodations, exploitation and scams, people seem more greedy / mean / selfish / violent, reduced interactions, widespread depression / anxiety / fatigue, no meaning or purpose.

in-person social interactions and obligations)	
--	--

Name	Jason Montgomery
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant health challenge I see in my son who has autism is his sleep schedule. He is 23 and unable to keep a normal sleep schedule. He often sleeps 12+ hours, and his schedule shifts from sleeping in the morning to sleeping at night to sleeping in the daytime. It seems to be his biggest challenge, and he is often exhausted.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am not a doctor, but I believe that my son is mildly depressed. He also doesn't have good executive functioning skills, or the ability to make plans, remember them, and follow through with them.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son finds it difficult to function in social settings. He can mask, but his desire is to exit the situation as soon he can. I think his difficulties with executive functioning also fit in this category.
What additional research is needed to help address co-occurring conditions for autistic people?	I think there needs to be research aimed at the common issues that autistic people deal with: - social deprivation - sleep deprivation - executive functioning issues - sensory issues
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above listed in the questions. I think that those with autism need services in school, in college, and in living situations. Having someone that can assist a person with Level 1 autism can change that person's life. Insurance coverage for these services (or government coverage) is critical.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	For my son, similar to what other have seen.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I would say similar to non-autistic individuals.

Name	Javier, Advocate
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal issues, anxiety and learning disabilities.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, ADHD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, I myself as an autistic adult and also a parent to my child who is also autistic, we should receive more help and insurance coverage to have access to more counseling and psychology help.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID was a very frightening experience, I was very depressed during the initial start of the pandemic.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increase use of Telehealth

Name	Jeanine Castagna
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Autistic people have deficits in communication skills to express pain, discomfort, or other issues related to medical conditions. As a result, conditions are usually not caught as quickly as when it affects a neurotypical person which affects treatment. Also, the healthcare system or lack thereof for these issues make getting treatment difficult
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Autistic people face ableism and struggle with social situations. These usually result in low self esteem and loneliness. With a lack of appropriate coping skills, it can get exhausting and mental health can be affected
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Interviews with autistic people and families are necessary for research to identify barriers.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Pay autistic workers minimum wage, recruiting and retaining qualified providers for autism services (right now lack of staffing is a huge issue across agencies), increase job opportunities and employment services for autistic people
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID 19 made child find and crucial early intervention very difficult to find and access for autistic people. Which overall affected development
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Autistic children had their routines thrown off completely and suddenly which put a pause on learning. They also struggled with remote learning.

Name	Jeannie C
Demographic	Autistic individual; Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory processing disorder completely distorts reality and makes noises seem louder and scarier and lights at night are too bright for me to drive safely. I also have OCD and anxiety which significantly impacts my day to day executive functioning.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Having ADHD and Autism is very confusing because while one disorder pulls at the side of our brain that likes routine and structure the other seemingly disorganized part of the brain craves spontaneity and newness.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenge is the communication and social disabilities. There are a lot of non verbal social cues that we are expected to know and use in order to navigate social situations. While I have learned how to get by with small talk and socially acceptable scripts, I require a lot more down time and recovery time from social obligations than most neurotypicals. Also, growing up and not having a sound understanding of my differences played a huge part in me being bullied for being perceived as different than my peers.
What additional research is needed to help address co-occurring conditions for autistic people?	SO MUCH RESEARCH!! Right now we operate in small online communities where we share our own lived experiences as autistics. We need people from and within the community who are on the spectrum to be apart of this research. We need to be testing children at young ages to detect early childhood autism which then can link that child with occupational therapy and other services; NOT ABA (basically conversion therapy to appear more neurotypical while harming the autistic individual immensely) and the child can build on their skills and find areas within their development that might need more assistance and guidance. The goal is not for the child to be less autistic but to be more educated in their autism so that the individual/parents can find useful accommodations to make their day to day lives more bearable and enjoyable.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Having a thorough screening process for all children whether or not they present early autistic traits or not. Most parents are not aware of the signs or symptoms of early childhood autism so they miss these children completely and the children grow up feeling inherently different than their peers so they begin masking at young ages and begin the slow descend into what I believe manifests early anxiety related to social situations. We need equal access for all children in public schools to early autism testing. From there we need accessible and affordable services for these children and their families. We need education GLOBALLY on autism and how common it is and the ways to nurture our community. We can and will save lives with early detection of autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The reduced in person social interactions and obligations have been a reset for my nervous system. Making health/store systems more accessible to disabled people has been one of the positive outcomes of social changes post COVID-19. Being able to do pick up orders and avoiding the dreadful overstimulating stores has been helpful.</p>
---	--

Name	Jeffrey Poms
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	many autistic people experience physical illness among which are sleep disturbances which can lead to a lack of focus, mental fortitude and ultimately burnout. Sleep disturbances are also a large contributing factor to persistent, treatment resistant depression and anxiety.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	statistically 85% of autistic people are unemployed or can not maintain a job. this is often because workplace accommodations are not readily offered, available or granted when requested. Depression can be so severe that the individual may not be ABLE to get out of bed to go to work, even those who work from home. This leads to self harming behaviors and even suicide as the autistic person can't get or maintain employment and if they lack a sufficient social structure which most do, suicide rates skyrocket at the thought of not being able to pay bills, afford healthcare, support services etc. one becomes hopeless as its a never ending cycle that when not escaped many feel there is no other option then to end it themselves.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	a lot of autistic people are very intelligent but may struggle to communicate in ways well received by their allistic counterparts. We have regulated trainings in every major employer for workplace violence, harassment, diversity including now the trans community, why can we not add regulated information on neurodivergence?
What additional research is needed to help address co-occurring conditions for autistic people?	Autism research has really only just begun! It started with Dr Asberger who only believed boys were affected. Most with autism have been misdiagnosed with personality disorders like narcissism, anti social disorder, psychopathy, sociopathy and borderline/bi polar... there are even cases i've found where in the early 1900's through to the 40's many boys were institutionalized as they were thought to have schizophrenia. Girls have only just recently in the last 20 years begun to see how they present differently than boys. much more research needs to be done on the genetics, family history.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above examples! but a particular point that i've encountered is that at 44 years of age and having suspected for YEARS that i had autism its taken 2 years to find a provider that was 1 in network and 2 which was most difficult available who did ADULT assessments. people in my generation were often overlooked especially those in the autistic community who are high masking and have communicative skills because well, we figured out how to "make" ourselves fit in but this of course comes at a great cost to our energy and mental health.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Jeffrey Reeves
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	For me it is a struggle with alcohol issues. I so wish that it made me a dominant alpha male tough guy, but it makes me more depressed and confused and it is chemical dependency and not a fun party. That's all that I can think of for myself.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have been afraid of my own shadow for most of my life. I was always easily intimidated and dominated. Anxiety and depression has ruled my life. I can't concentrate because I have been gaslighted and betrayed so much. I am cursed with Dyslexia also, and a Dyslexia of thought as well. I have always been easy prey for predators and parasites. Everyone for the most part is plotting against me also. I am cursed with ADHD also. And no one likes me and everybody is against me.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have tremendous difficulty with following instructions. I am totally [redacted] at Math. I am constantly tortured with "Remembrance Of Things Past". In a battery of test it was observed that I cannot learn from visual instructions. Something to that effect. I say the wrong thing to the wrong person. I don't react quickly enough in social situations.
What additional research is needed to help address co-occurring conditions for autistic people?	I read that the Amygdala part of the Human brain is more accelerated in autistics. That has been my lifelong curse of being afraid and hopeless. I've not had anywhere near enough sex. Young Women need to have sex with me and we will discover if that cures the Aspergers/Autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Vitamins are what make me functional. Tell autistics to try vitamins. Equitable access to and accessibility of services, and service systems issues too. Vitamin B-100, Magnesium, Fish Oil, Flaxseed, are beneficial.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The vaccines that I received seemed to benefit me in recovering from the China Plague.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I really need Human contact and the China Plague prevented that.

Name	Jeffrey Slater
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Anxiety/depression, ADHD, alexatymia
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Managing mental health amid coping with autism-related traits
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Overall mental health, for me anxiety and alexatymia
What additional research is needed to help address co-occurring conditions for autistic people?	Better understanding of autism-related traits specifically in adults and how they contribute to co-occurring conditions
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better awareness and knowledge among providers of autism in adults
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I see this is the last question, so let me take this opportunity to say that these questions are ridiculous. You're asking me to describe the entire autistic community, even though that's literally the job of the research you're wanting me to comment on. Furthermore, these questions betray a fundamental lack of a modern understanding of autism. Spend some time on online forums where autistic adults share experiences and further their understanding of themselves. You'll quickly see how far ahead of your studies we are. We still need the scientific rigor, but wow, you all have fallen behind even the most obvious of areas.

Name	Jeffrey Thomas
Demographic	Autistic individual; Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor challenges, creating comorbidity of eating disorders or substance use disorders to ease the sensory input. .
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, social isolation, ADHD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities that result in an inability to express needs to doctors/healthcare professionals.
What additional research is needed to help address co-occurring conditions for autistic people?	We have plenty of individuals such as myself who have had to live with this condition and make due. I will never be successful because I am unable to hold a high responsibility job, so I am only able to work as a teacher aide or gas station attendant and have been stuck in this cycle of poverty due to my disability.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, stipends, accessibility. Things that normally insurance would cover (mental health therapy, physical/occupational therapy) haven't been covered by my insurance in the past because supposedly my issue is not "severe enough"
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Humans are complicated and social creatures. The pandemic completely changed how we interact with each other, And now we essentially have to entirely relearn every new societal norm and social interaction queue that has come about because of COVID and the isolation we all faced during quarantine.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	During quarantine in the pandemic the remote work and a remote doctor appointments were a lifesaver, but we have begun making a shift away from that because able-bodied people are able to and it's better for company's bottom line.

Name	Jemima J
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Some of the most significant challenges I have noticed, as sensory issues and GI issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, hyperactivity and aggressiveness
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Some of the challenges I have noticed are problems in socialization and inappropriate social approach. Communication problems are also common.
What additional research is needed to help address co-occurring conditions for autistic people?	Research looking into deviations in development of speech that contributes to inappropriate social approach. Memory processes that may play a role in repetitive and ritualistic behaviours.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	-Caregiver training programs that are aimed at early detection and intervention. -Developmental monitoring that collaborative in nature, involving all stakeholders in the child's life, parents/ therapists etc. - Community level interventions. -Access to free resources.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Anxiety and delayed achievement of developmental milestones
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positives: Parents/ caregivers became more proactive in the child's life/ more aware of their functioning and needs. Perhaps even more creative in meeting these needs without access to regular facilities. Negatives: Disruption in services vital for them/ disruption in play opportunities and avenues for socialization.

Name	Jenise Woolf, Parent
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have an adult son who has had multiple ED visits as well as inpatient psychiatric admissions. I have had to beg, usually unsuccessfully, for physical health issues to be evaluated. I'm quite certain many incidents of crisis behavior are due to dental problems, constipation, and/or other health issues. It is not possible to get him to a dentist if there was one. We rely mostly on telehealth for doctor visits due to behavior. My son has ASD, bipolar disorder and IDD.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There continues to be confusion between symptoms and behaviors. The DD system is not equipped or trained to deal with mania, psychosis, etc., and the BH system has not done well with adapting therapies and clinical resources. Most of all there is a huge lack of integration between the systems!!! Hospitals are ill-equipped to provide inpatient admissions, medical or psychiatric. Sensory equipment and basic behavior modification should be included in treatment and OTs / BCBA's should be part of treatment teams.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Mental health conditions are so pervasive in ASD (OCD, anxiety, bipolar, PTSD), yet there is so little treatment being provided. Clinicians and medical professionals MUST be trained not only to recognize this, but also learn how to adapt treatment interventions.
What additional research is needed to help address co-occurring conditions for autistic people?	The NADD is a wonderful resource for information and data, but more needs to be done to disperse the information and bring about change to the way states, agencies and hospitals provide services. There needs to be more research into effective therapeutic interventions. ABA is not the solution to a manic episode. Approximately 90% of individuals with ASD have experienced some type of trauma, more research needs to be done on prevention, self-advocacy, and most importantly, treatment.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better integration between DD system and BH system within State Dept of Mental Health. Doctors and especially psychiatrists should receive training in dual-diagnosis. There should be standard protocols for dually-diagnosed individuals seen EDs to rule out physical causes (dental, constipation) with each evaluation. Early intervention services should be more accessible, no wrong door, whether entering through BH system or DD system, and individual should be able to receive services without being screened out.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My son will no longer leave the house. He was on a wait list for a day program, which had to close during COVID. Staff turnover has, and continues, to disrupt programming.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth has been a wonderful tool that allows appointments to occur, which we would otherwise have had to cancel due to behavior issues. The disruption in services during COVID definitely derailed things. My son has become used to sitting at home and it is a struggle to get him back into any type of routine.

Name	Jenn
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Anxiety
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, aggression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Adequate supports and accommodations in schools. Most schools do not recognize a medical diagnosis of autism and do not have the funding to provide adequate supports, so they refuse an IEP to autistic people on the grounds they do not have an « educational diagnosis » of autism.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Additional educational and employment options
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jenn Raley Miller, Parent
Demographic	Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Differences in sensory processing, sensory integration, and sensory perception.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My child, now age nine, has been assessed by a pediatric neurologist as "twice-exceptional": sensory processing disorder + ADHD + gifted. In the primary grades, we had conflicts with therapists and educators who insisted that the diagnosis must be ASD. Yet the ADOS result was "minimal-to-no evidence of autism" and the SCQ score was 11. Our family is only one example in which different providers have different interpretations of neurodivergence.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	There is very little understanding of how the spectrum of intelligence, from ID to profound giftedness, interacts with other dimensions of autism.
What additional research is needed to help address co-occurring conditions for autistic people?	- Research is needed to establish better definitions and measurements for ASD vs. ADHD vs. SPD etc. Overlapping behavioral definitions are causing confusion. - More research is needed into how the spectrum of intelligence, from intellectual disability to profound giftedness, interacts with the forms of neurodivergence listed in the DSM.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	- Policy and systems change is needed so patients can access Occupational Therapy regardless of whether they "come in through the autism door". The OT community has established excellent assessments for sensory needs, including interoceptive, proprioceptive, and vestibular. - Insurance plans should be directed to approve Occupational Therapy without conditions, as a first-line therapy for individuals with sensory differences. - Funding is needed to attract practitioners to specialize in pediatric and/or sensory integration OT.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jennifer Colberg, Grandma
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor issues, sensitivity to food and safe foods they are willing to eat, stomach issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self injury, anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Non verbal, cognitive delays
What additional research is needed to help address co-occurring conditions for autistic people?	There is so little being done and with the rise in level 3 autistic children we need to catch up sooner rather than later
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services available especially in rural areas, insurance for families that don't qualify for assistance but don't make enough to purchase good insurance
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Early intervention delays and set backs. My grandson had just started early intervention when the shut down happened and we are still playing catch up because none of the services were available and none of the services were made up after shut down so he lost so much
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruption in services and no attempt to make them up

Name	Jennifer Higgins
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	anxiety, depression, sensory issues, repetitive behaviors, noise sensitivity, intense, eating disorders, narrow interests, acting without thinking, emotional dysregulation, OCD, over eating
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, social phobia, excessive worry, OCD, hypervigilance, mood instability
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Pathological Demand Avoidance
What additional research is needed to help address co-occurring conditions for autistic people?	Pathological Demand Avoidance
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equal access to services for all who are labeled as autistic rather than based on income level. Standard level of care or therapy for those diagnosed with autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jennifer Proffitt , Parent and Teacher
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has gastrointestinal issues, as a child he had baby hemorrhoids and bloody stools. He also has a hard time using the restroom as a teenager. He slept so hard that he could not wake himself up to use the restroom and would wet his bed until age 14. We have had him on medication now that helps with that. He also has sensory sensitivity to sounds and needs to wear headphones. He does OT, ABA therapy, and mental health therapy.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	He has depression, anxiety, adhd, when he was younger he had aggressive and self-injurious behavior. I feel like he has RSD rejection sensitive dysphoria. It's intense anger when someone hurts your feelings or rejection or criticized assume no one likes you and is overly sensitive. So far none of the doctors I know have anything to help me with this.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My child has dyslexia as well as autism and adhd. He has been in Reading tutoring since third grade that we have had to pay out of pocket for because public school does not do the Barton reading method. He is in high school now and still working with his reading resource teacher. He goes twice a week and has since third grade he is now in high school. This not only costs a lot for us but because of the autism and the ADHD it is taking him a long time to finish the program. My sister's child with dyslexia attended a private school in LA where they had the burden reading method. They worked with him everyday for about a year and a half and he can read fine now. Why can't public schools use the Barton method?
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more research into RSD rejection sensitive dysphoria. There needs to be more research done on dyslexia and programs implemented in public school systems. There needs to be emotional support and mental health counseling for students in every grade level every week. My son has not had any friends other than the ones I have helped him make. It is very lonely at school for him and others with autism. Best buddies did not do anything for him. There needs to be a system in place for helping children with autism integrate into the social aspect of their schools by having a peer mentor, a group, or other Outlet so that they don't feel alone.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance should cover every aspect of autistic care. Whether it's doctor's appointments, medication, tutoring, therapies, and especially respite care. There needs to be After High School additional schooling that is publicly funded. There needs to be support with going into Community College for autistic adults who can handle this. This should also be funded by the government. Parents should be reimbursed for being caregivers for their own children. There should be screening through every Milestone doctor's appointment for autism and School screening starting in preschool.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Autistic individuals should not be required to take mandatory vaccines. When the government wanted to make it mandatory that everyone got the covid vaccine this was not an option for our child. Their immune systems and body chemistry are extremely sensitive to medication, food, household cleaning products, etc. Forced vaccines are never an option. Government needs to realize that especially for people who have children on the Spectrum as well as other impairments such as ADHD etc.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Reduced rigorous educational activity, disruption in therapy services, disruption in regular schedules which is a huge deal for people on the spectrum, reduction and social opportunities for them to grow and learn.</p>
---	---

Name	Jennifer Quigley
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	For my child, medications for autism has caused significant weight gain leading to increased isolation and decrease in social skills. His gastrointestinal concerns have also caused him to miss school and have issues fitting in with his peers. Sleep disturbances causes troubles meeting a normal school schedule. For my son he gets up at 5am and is ready to start school and can get frustrated by having to wait.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The aggressive behavior and lack of impulse control have caused him to be totally secluded from peers in school. It also led to a large number of restraints, lock downs and seclusion rooms.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son is 2E and has a very high IQ learning isnt difficult for him. People are.
What additional research is needed to help address co-occurring conditions for autistic people?	More about medical implications.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Eliminate Medicaid waitlists and income limits. No wrong door is important for families without knowledge of the systems that support people.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Significant for my son. It derailed his early advancement and stopped his learning do to requirements to be on camera.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jennifer Reppond, autism parent
Demographic	Family member of an autistic individual; Researcher
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>The biggest challenge is that the medical community cannot get on board for treatments that are outside the box. To get actual healthcare therapies and protocols, we have to seek those doctors who have taken it upon themselves to delve into the medical treatments that are out there and the new research that is coming out every day. They don't take insurance because insurance stifles the healthcare that our children need. Our son had gastro issues when he was younger, and we took him to a gastro doctor - he said there were no issues, take some laxatives, and sent us on our way. The "in the box" doctors check their boxes and shuffle us out, not helping us AT ALL! So I pay monthly for pharma-grade, highly bio-available supplements because the gastro issue stems from gene issues called MTHFR. No doctor checks for this EVER unless you ask, and some refuse. It turns out that both my autistic son and my ADHD son have this problem. So, they cannot dispense toxins from their body or ingest the proper nutrients from their food. Many of these nutrients are imperative for the GI system to work correctly. How about the medical community catch up to where we are? I'm tired of fighting with our medical professionals because they have ZERO clue. The GI tract is essential to the other examples listed above - sleep issues, skin issues, stemming, and brain issues due to substances getting into the blood and ultimately breaking the blood/brain barrier.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>The biggest challenge is that society needs to understand how these things are intertwined. I have a son moving on from 12th grade who is not ready to enter adulthood. I am doing my dissertation on cooperatives between ISDs and the community they serve. Most of the community (businesses, organizations, etc.) need to learn about people on the spectrum. They need to learn how to handle them or work with them. With 80% of this population doing nothing after their public education ends, they become severely depressed because there is no more interaction. And not that public school interaction is much better since most school kids ignore them, but someplace to go and something to do is better than sitting at home. Depression and bad experiences lead to a host of issues with this group because it is hard to find dedicated, caring, and compassionate people with patience. So far, I have run into no one that even knew that there was a problem, and I did not know that the ISD I am looking into have programs that they could work with to help in the experience and education of this population. Most of them are anxious due to the impatience of others not understanding how to take the time to educate, explain, and show them (as many times as it takes).</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>This goes along with the last question. But many of these kids (young adults) do not understand how "humans in society" work. They don't see the logic in anything people do, and parents so desperately try to make their children fit the "humans in society" mold. When they can't, the child (young adult) gets frustrated, depressed, and angry because they cannot understand or express things to get their point of view across. They also do not know why things are done the way they are. My son understands that you need money to buy things, but that is about the extent of his understanding of money; many people on the spectrum are the same way. They also do not understand figurative language (which is almost 100% of how Americans communicate). This is why my husband, I, or my other son needs to be with our autistic son so that we can explain things to him. The people dealing with him don't know how to communicate. Some people tend to be leery of the bluntness</p>

	<p>of autistic people. We always tell people that if you don't want to know the truth, don't ask your son. Unfortunately, transfer of learning is almost impossible with persons on the spectrum. That is why teaching them is hard, and patience has to prevail. Lack of training and knowledge for people not on the spectrum.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<ul style="list-style-type: none"> • Professional development for general education teachers, para-professionals, staff, and administration currently in the classroom. • Proper education at the university level for ALL teachers - not just those choosing special education. • More training and education for doctors, etc. so that parents aren't left feeling like they are alone. What I learned about autism did not come from any of our mainstream doctors. It came from hundreds of hours of interviewing professionals in the field as well as reading and researching journals, articles, and research materials. • Training and education that is manageable to the parents. Lots of great things are going on, but I was never told about one. I know them because I stumbled upon them. Most parents are not working on 3-4 advanced degrees; they want to know what the path is. • There needs to be a path - to some degree - that is standard - to some degree - that parents can be led to - and helped along the way - with people who can guide them. Governmental entities are a joke and a waste of time - and chances of anyone getting services after years of waiting to come up on a list - are slim to none. • Training and education for the community – employers – organizations – churches – etc.
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>1. Disabled people are the most discriminated people in the world. Put focus on the outlandish discrimination experienced by disabled people. 2. Medical therapies, etc., need to fast forward and intersect where research is today. The medical community needs to admit that they have no clue how to treat people on the spectrum. And in doing so, make the changes necessary to help parents. 3. Education needs to get on the ball in the public education classroom and the university lecture hall. 4. Insurance needs to stop dictating what treatments are acceptable. Last time I checked, doctors are supposed to decide what treatments are best for each of their patients. 5. Community education (all the community - employers, local governments, churches, civic organizations, non-profits, etc.). Sponsoring conversation cafes would be a start - to get movement at the local level.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>My son was distraught with the whole COVID-19 pandemic. He still cannot get off talking about how this entire thing ruined his life. It stopped his life as far as he was concerned. He hated being stuck at home all day and not going to school. Our son is a planner, and this ruined all his plans. He had outbursts of anger that we had never seen from him. When he wasn't angry, he was weeping because he did not understand, and when we couldn't answer his questions or give him understanding, he was just depressed. I know some who did not want to rejoin society after the pandemic and secluded themselves. Our son is still mad at what he considers lost time and moments. One way or the other - mad that life stopped or not wanting to rejoin life - is terrible. So, I believe it did have mental health ramifications as well as ramped up more physical ailments. Stress, anxiety, anger, and confusion all mess with the mind and, if prolonged, can mess with the physical body, causing all sorts of problems. When you don't feel good physically - or mentally - you act out and behave differently.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on</p>	<p>The reduced in-person social interactions hurt the most. Most children on the spectrum regress when they are not consistently in their schedule. Taking them out of their "known plan" upsets and possibly scares them. They</p>

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

cannot take change. Aside from a known schedule, they need interaction with others. My son needs interaction with others. The daily interactions with his peers, teachers, and staff members at the school help him grow and learn.

Name	Jennifer Sibley
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has significant issues with sleep and having Autism. He does not have a regular sleep schedule and has to rely on medication in order to fall asleep at night. When he does sleep, he often does not sleep through the night. He also has significant sensory challenges that make going in public difficult. He is challenged by noises that most of us would not be troubled by and because of this, he looks for those sources when he goes out and avoids them to the point of disrupting his day.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My son has Autism and Anxiety. We have not been able to successfully help him manage his anxiety as he has limited verbal skills and is not able to participate in traditional talk therapies and there is no medication management that we have found so far that helps to decrease the symptoms of his anxiety. In our area (rural Northern New York) we also lack providers who are able to treat individuals who are dually diagnosed with I/DD and Mental Health disorders.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son with Autism has significant challenges with communication. While he can speak, and answer basic questions, he cannot carry on a lengthy conversation, answer questions about his health or well-being or his wants, needs and desires about living independently. This limits his choices as an adult for independent living.
What additional research is needed to help address co-occurring conditions for autistic people?	More research needs to be done around effective treatment for individuals with Autism and co-occurring anxiety disorders (or any mental health disorders), particularly, those with communication challenges, so that these individuals can participate actively in their own treatment.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Expanding medicaid services for individuals with Autism would be a step in the right direction. Medicaid reimbursement rates, compared to the rates for commercial insurances, are not even close to comparable, which drives many medical practitioners to not accept Medicaid reimbursement. This in turn, limits the providers that individuals with Autism can choose from for medical services. There should also be some work into incentives for new providers to set up practices in rural settings. More providers equals greater access to services for individuals across all disabilities.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	COVID-19 has made it more difficult to retain talented staff to maintain the services that my son requires in order to live in the community. He has been through 5 care coordinators since 2020, and this is a low number compared to some of my friends and their family members. I am pleased with the increased access to Telehealth services as it does make it easier to attend services and medical appointments. This has eliminated the need to travel from work to home to get my son, then travel to his appointment and then back again. Telehealth means that I can attend from work and my son can attend from home with the support of his paid staff member.

Name	Jenny Folley
Demographic	Autistic individual; Family member of an autistic individual

(Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	adhd depression anxiety pda
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	adhd pda
What additional research is needed to help address co-occurring conditions for autistic people?	more surveys more info to gps
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	more info to schools and gps
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Long term fatigue long term chest pain long term asthma symptoms long term cramps
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	positive- people are more aware of diversity and needs in adults negative - children are under more pressure to catch up and school is seen as a cure for everything

Name	Jesenia, NeuroSpicy Networking
Demographic	Autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	EDS, sleep disturbances, lack of supports for adults, late realized, lack of access to official diagnosis, danger of obtaining diagnosis and social determinant of health as well as medical gaslighting, medical trauma, ableism and racism in they system and the individuals in the medical system, lack of reproductive care, lack of agency, lack of access to thriving wages, lack of stronger ADA protections. Many employers allowed to discriminate because most of us can't afford to sue or have the energy to do so while we are trying to survive and not become homeless, which is on the verge of becoming illegal so they can criminalize us and put us into modern day slavery (aka the prison industrial complex). Lack of access to Occupational therapy's and accommodations in everyday public life including mask mandates, ADA compliant spaces, broken equipment, untrained staff, equipment not withing accessible range (aka miles away), no reliable public transportation, no funding for in home care, no funding for transportation, no funding for adaptative supplies, or prohibitively priced, and unable to be gainfully employed or keep employment due to lack of all accommodations and supports and ablest employers and coworkers.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	lack of support from they system designed to keep us in poverty and in the conditions of death. depression from not being able to afford to live. 85% of autistic people are unemployed or underemployed AND have college degrees. anxiety from being gaslit by providers that won't take our conditions or health seriously by believing us or wearing a mask to protect us from covid. ADHD which is not well managed by med, hard to access due to barriers and bias of providers, and unaffordable since we don't have access to job and thus healthcare. suicidality because the systems keep us in the conditions of death and no community support due to eugenics and ableism pervasive in our oppression.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	lack of knowledge by the general public, trained practitioners, and psychiatric professionals about how the inter-play of co-occurring conditions AND cultural heritage play into the presentation and affects of ASD with other conditions. Most times we are spending time teaching rather than being treated. Also the pathologizing of our condition rather than listening to our lived experiences and to the now emergent Autistic researchers, pathologizing language and "deficits" instead of realizing that we are multi-lingual, we have been learning how to speak in "allistic" allistilese for our whole lives and masking is draining us. Lack of consideration for our skillful communication within our own community, not having any failings but rather focusing on the social model of disability and the 10 principles of disability justice.
What additional research is needed to help address co-occurring conditions for autistic people?	All autistic research teams AND they must be DIVERSE in culture, ethnicities, genders, and avoid replicating the issues of dominate culture and white supremacy culture. Until we listen to all autistic stories, we are not including the most marginalized or being intersectional in understanding the spectrum. This includes non-speaking and non-verbal autists. Also, need to look into the interplay of nutrition, AND co-occurring conditions such as EDS, Marfans, hypermobility, POTS, MCAS, IBS, Fibromyalgia, MFCFS and Long Covid.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access	UBI, universal healthcare, food is human right, autonomy is a human right, access to sexual reproductive care and offering housing is a human right, education and training made by autistic adults, removing childism and ablism from structures and resources, creating Autistic sensory compliant laws and

<p>to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>enforcement for workplaces and all public spaces and venues. Remove the institutionalization and incarceration of autistic and disabled people, remove modern day slavery allowed in the 13th amendment. Offer advocates and trained support specialists for all autists regardless of age and abolish hate groups such as Autism Speaks and ABA therapies on autistic people, especially children. Require cultural competency, and sensitivity training, DEI, and CRT to ALL staff engaging with disabled people. Require continued training for all medical staff on infectious diseases, care work, and latest research on autism and comorbidities. Require patient-advocates for all interactions with the medical, education, judicial systems. Require employers pay for and provide third party legal services to all disabled employees to incentive them to not discriminate their employees. Require affirmative action for employers making over 5 million in revenue to require at least 40% or more of their workforce be disabled employees or pay 40% more in taxes to cover disability health costs. Remove limits on asset building for disabled people to have access to healthcare.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>covid like HIV has been horribly handled by the governments and politicians politicizing a deadly cumulative auto-immune disrupter. The misinformation and disinformation has deadly consequences on an already vulnerable population and social determinates of health are even more impacted by the lack of precautions, we also have to deal with minor co-occurring physical and mental health becoming flared or activated by degrading and dysregulated immune systems. Then add to that the lack of care from healthcare providers to believe us or take us seriously in knowing our own body-minds. It is a MASS DISABLING EVENT. It is not a matter of if you will become disabled but when. The future is and will be disabled by the our lack of care towards disabled people. eugenics runs deep in this colonized society and we must center care and compassion if we are to survive as a whole.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Positive for a short while was the access to remote work, but as the society continues to gaslight and remove access to remote work and access to public spaces with out covid precautions we are again entering the age of the ugly laws returning. The understanding that our systems are not meant to protect us.</p>

Name	Jess Butler
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Joint pain/hypermobility causes SEVERE pain. Esophagogastric dysmotility causes swallowing difficulties, gastroparesis, SIBO, malnutrition, leaky gut, constipation, bowel impactions, bowel obstructions. Sleep disturbances cause daytime sleepiness, preventable incidents/accidents, brain fog, cognitive dysfunction. Sensory challenges cause SEVERE meltdowns if not appropriately prepared for: everything is either TOO or NOT ENOUGH. Too bright, too loud, too smelly, too scratchy, too much in general causes overloaded senses. OR not enough stimulation causes the "stims" that non-autistic people hate so much and wish to "treat out" of us. Things like hand flapping, finger flipping, toe and foot movements, spinning around, watching spinning things, fascination with little parts of objects, lining things up by color, category, etc. Motor challenges cause instability, lack of coordination, and result in falls, dropping things, etc.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression and anxiety begets suicidality or SIB. Depression and anxiety are often very difficult to treat and the meds have pretty significant side effects: emotional numbness, apathy, sedation, weight gain, high blood glucose readings, flat affect, etc. ADHD causes impulsivity in many forms (overeating, oversexualized status, overspending, etc.), inability to focus (makes us seem "stupid"), hyperactivity makes us unable to remain still when required to do so, etc. Aggressive behavior makes us look "mean" "unpredictable" etc. SIB may cause us to get committed to mental institutions, cause infection, etc.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning difficulties: render us "unable to be taught" and result in us being put into life skills classes and being given up on by teachers. Developmental disabilities, depending upon WHAT is disabled, can be detrimental to mobility, communication, etc. Intellectual disabilities: everyone just eventually "gives up on" us, thinking that we "cannot learn, so why waste time trying" Communication difficulties can lead to a whole other set of difficulties, especially when NO effort is put into trying to obtain some sort of communication device (or when the insurance repeatedly DENIES the purchase of a communication device)
What additional research is needed to help address co-occurring conditions for autistic people?	STOP with the "biological" research--just take it that we HAVE autism and help us try to live with it, do NOT attempt to explain it away, and possibly raise the issue of EUGENICS: breeding out autistics by pregnancy termination, fertilized egg cell selection, etc. Research medications that will help treat the symptoms of autism: there were promising oxytocin research trials--what happened to that? Research ethical treatment/therapies for the symptoms of autism--STOP using/recommending ABA and behavioral modification therapies because they are DEGRADING to autistic people! Research the gut-brain connection and immune response system to see where treatments can be aimed (like the microbiota transfers) AND force the insurance companies to cover these procedures! And actually, THAT would be another MAIN concern--forcing insurance companies to actually cover any medications, procedures, or treatments discovered by thorough research!!!
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	FUNDING. Plain and simple. Cut some of the military trillions and throw like a few billion at the autism industry for once. There is a dire shortage of experienced, tolerant service workers. They don't want to work because their wages are PATHETIC for the jobs that they do. There is high turnover, which is detrimental to getting treatment to "stick." Service organizations go out of business for the same reason. There is a total LACK of understanding that ABA and other behavioral-based therapies are DEGRADING to autistics. We are NOT "broken" so we do NOT need "fixed," what we NEED most is

	<p>help to live in a "foreign" world. We need funding for supportive housing, funding to pay the workers who support us, funding to pay for employment services, funding for AAC, funding is the key. But we KNOW we will NEVER get it from the US Govt.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Probably not a whole lot, you see, because many autistics LIKE to stay home, so the whole "stay home" thing was not like the punishment that the NTs thought it was. It actually SPURRED on things that HELP us, like telemedicine, remote work/work from home jobs, etc. I don't know any autistics who had COVID-19, possibly because our immune systems work differently than NTs.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>As I stated in the last answer, POSITIVE impacts: MORE telehealth, MORE remote work and school (MY kids THRIVED during the school shutdowns and hated to have to go back to the classrooms!), LESS social interactions and obligations is ALWAYS a good thing for us, because we see those things as AWFUL, not enjoyable.</p>

Name	Jesse Scott
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory overload from public restrooms (toilets and hand dryers) being too loud, sensory awareness of the urgency to go before an accident happens, bladder and bowel incontinence. Chronic constipation.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Significant challenges with mental health include ADHD, Anxiety, aggressive behavior under stress. General anxiety in social situations.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Ability to self-advocate, knowing when to ask for help when having challenges. Processing too much information independently can lead to stress without support.
What additional research is needed to help address co-occurring conditions for autistic people?	Causes of incontinence, sensory overload, lack of body awareness. Research investigating autonomic nervous system dysfunction connections between incontinence, GI issues, seizures and other physical health concerns. Neurodiversity-affirming intervention models addressing mental wellness challenges exacerbated by incontinence-related anxiety, depression or trauma.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Increased insurance coverage for specialized products, prescription diapers/pull-ups, assistive devices and mental health counseling related to incontinence management. Mandated accessibility standards so facilities have ample family/accessible restrooms, changing tables and sensory-friendly spaces for intimate care needs. Cultural competency training so providers understand autism-incontinence intersections, ask appropriate questions, and accommodate appointment structure/environment needs. Self-advocacy and system navigation training autistic voices are centered in informing policy improvements over time.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation/changes in routine/structure disrupted established incontinence management plans for some, potentially exacerbating physical symptoms. Loss of employment/income led to inability to afford specialized products for incontinence/prescriptions, worsening well-being. Overstimulation/distress from extensive safety protocols/PPE requirements made it harder to self-advocate needs and tolerate intimate assistance if needed.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Positive impacts: Increased telehealth access has benefitted some by improving continuity of care during isolation through virtual appointments/services. Work/school accommodations allowing remote participation have enhanced inclusion for individuals whose incontinence may be exacerbated by traditional in-person settings. Reduced social/sensory obligations gave respite to exhausted caretakers and those whose mental health relies on low-pressure environments. Potential negative impacts: Prolonged isolation has worsened anxiety/depression for individuals reliant on

in-person social interactions and obligations)	community support systems and face-to-face interaction. Disruptions in daily routines and structure removed important coping mechanisms and management support for physical health conditions. Transition challenges reacclimating to pre-pandemic expectations have taken both physical and emotional tolls, especially without adequate accommodations.
--	---

Name	Jessica
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Since childhood I've had sensory issues which made it impossible to wear certain fabrics and eat certain foods. I can remember varying forms of insomnia as early as elementary school. These problems have persisted into my thirties where I experience difficulty falling asleep and staying asleep. Before falling asleep I also often have an extreme falling sensation which causes me to jerk violently. I also have gastrointestinal problems which include constipation, and as I've aged, severe heartburn. I needed glasses before the age of 22 due to nearsightedness and an astigmatism, and I experience something known as visual snow. My bladder also hurts, and I pee ALL THE TIME. The problem I deal with most, however, is constant pain. Since I am also female this pain is often ignored, and I'm often treated as if I'm drug seeking so I've learned to just deal with it. My joints used to be hyper-flexible, and some still are, but they are now locking up as I'm aging. Doctors don't seem to care. These are not my only issues unfortunately. At 18 I had a tonsillectomy. At 22 and 23 I had vascular surgery to remove varicose veins from my legs. At 29 I was diagnosed with PMDD and at 32 had a hysterectomy because my periods got so bad I was passing blood clots the size of tangerines for days each month. When I was 33 I was diagnosed with IHH and had brain surgery to treat the underlying venous stenosis at 36.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression. We are criticized by others CONSTANTLY our entire lives and struggle to make friends. If it wasn't due to brain chemistry then being neurodiverse in a neurotypical society does the job. Anxiety. Our nervous system is constantly bombarded by demands it isn't equipped to deal with. This, in combination with the living in a world not built for us, often makes us really anxious. ADHD is commonly co-occurring. I'm and AUDHD'er myself. I know many autistics who struggle with BPD although I am not one of them.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I can't speak for everyone but I can tell you that my biggest challenge is socializing. It is a misconception that we prefer to be alone. We learn to prefer to be alone because people treat us so badly. We annoy neurotypical people just by being ourselves. I will never know how to comfort someone, and I will never be comfortable in a room full of people. Everyone speaks a special social language that my brain doesn't. If we could educate others on autism and eliminate stigma, society as a whole would be more accepting and kind.
What additional research is needed to help address co-occurring conditions for autistic people?	We need to research how girls present since most research is based on boys presentation. We also need to better understand the relationship between ADHD and ASD.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need to have access to friends. Autistic people often die by suicide because we lack social supports. A social worker assigned to us, friendship groups, support groups, and group classes would be so helpful. Most helpful, however, would be educational requirements in all schools teaching people who aren't autistic about our lives. If they understood that we weren't all the same but experienced similar trauma we might have a fighting chance at living healthier lives. We really need more understanding and support from society.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	We often struggle with physical difficulties so for many autistics long COVID is a huge fear. The stress of politics and illness has made our anxiety worse. We also have a high sense of justice so bitterness has also been a side effect of feeling disliked and not cared for yet again.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Personally, I'm more socially isolated. My husband is military and they stopped all the wives groups during COVID. I haven't been able to rejoin and making friends post COVID is somehow more nightmarish than before. I like telehealth. Now when I'm ignored at least I'm at home in my pjs. Plus I don't have to deal with people. I just really wish I could make friends and that there were things to do. Lots of businesses shut down. As far as services go... what services? There are no services for adults. If they did exist they are so difficult to access that someone with a nervous system disability won't have to capacity or desire to obtain them which is a huge barrier to care.</p>
---	--

Name	Jessica Bearden
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges in my work as a counselor include the self-injurious behavior that is a result of sensory processing issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The challenges are often getting school systems to make appropriate accommodations for co-occurring disorders. My experience with Alabama schools and mental health is that they do not have the proper training, understanding, and resources to meet the needs of autistic individuals
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	These challenges include communicating with autistic individual about their needs. Resources for alternative methods of communication would be helpful
What additional research is needed to help address co-occurring conditions for autistic people?	There is SO much research still needed. As a counselor, I see that autistic individuals have difficult processing traumatic events. What takes 3 months for neurotypical individuals takes double for neurodivergent. There needs to be mental health research regarding how to speed that up. Needs to be reseath in schools about their methods of addressing behavioral concerns. There needs to be research for families and what resources they need.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More insurance coverage. Insurance companies often will not reimburse for autism because it is not curable. However, there are ongoing needs that can be addressed with therapies. The lack of coverage restricts access to services... putting professionals in a bind to choose between steady, healthy income, and meeting the needs of the community. Alabama needs more support for families, more options for respite. The lack of community resources and access to care are causing chronic stress in families with autistic children... leading to chronic illness and burnout. Therefore, costing more money long term for insurance companies.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? Name	Jessica Blackmon, Just an ADHD dyslexic autistic girl
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I deal with problems with sleeping racing thoughts during nights where I'm so exhausted that I cannot fall asleep though.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I suffer from depression, anxiety, attention-deficit hyperactivity disorder, aggressive, and suicidality
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have ADHD and severely dyslexic I would love to take the time to be able to take classes to help me learn how to read and write so that way I can actually go back to school actually learn something that's not a trade skill, but unfortunately for my age I'm too old to get any assistance so I'm stuck working to pay bills and I do not have the time nor the money to afford such education I grew up it is School District that if you were failing any of your classes instead of finding out what was the matter with that student they would stick you in a autistic class where I fell behind multiple years because of it and yet I never had an issue with anything else besides my reading and writing so now I am stuck in a manual labor job and barely able to make it. So yeah adults that have ADHD and dyslexia on the autism spectrum we need help desperately none of us want to be in the position that we are we can do so much more in this world but it's not made to accommodate us so we are just left behind. PS please don't mind the grammar this is being written through speak to text on my phone.
What additional research is needed to help address co-occurring conditions for autistic people?	The correlation between families and their conditions along with the studies with the long psychological trauma that occurs in children to adulthood as well as the adults that are currently along with this is a huge can of worms honestly there's so much that it needs to be done that I can't fit in this message.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Yes there is a ton that needs to be done for autistic ADHD dyslexic adults. (1) Due to my financial problems of struggling I can't work and go to school at the same time it would not be possible to pay my bills and to do school it will take me too long for school and I would fail it because it takes me much longer to intake what I need to learn. (2) the expense to get a specialized tutor to help me with my reading and writing skills is the cost of rent at this current time of this questionnaire along with every tutor that I spoke to they want me because I'm severely dyslexic to be there 3 days out of the week for 7 hours I would not be able to work enough to pay my own bills and this tutor it would be impossible. I have much more to say but I can't fit it in your limit of characters
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I can only speak for myself on this one and only with some limited knowledge of what others told me. For many of us that suffer with executive dysfunction disorder from our ADHD are places became tombs of our own messes as much as we tried we got to clean a little bit took care of things

	<p>that we can take care of but there was not much to motivate us and so with many of the issues that come with ADHD and then coupled that with the autism we self-sabotage ourselves mentally I continuously talk down about myself beat myself up mentally because it made me feel entirely worthless that I could not achieve the simplest tasks with so much time that I am stuck with along with not being able to being the ability to learn a new skill due to my severe dyslexia going online to read and learn a new skill was more challenging and stressful it got to a point where I threw my own work desk across the room and had a nervous breakdown so yeah that's my story and quite similar to several others that have told me there's.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>We definitely reduce social interaction and obligations due to the fact that that was something that helped motivate me to be on time and get things done because I had to physically be there in the breakdown of routine was devastating because my loss of time became so bad that several days I wouldn't realize that it could be 8:00 at night and yet it was only one in the afternoon to me there is nights that I would stay up until 4:00 in the morning because I didn't realize that it was 4:00 in the morning for me and my brain even though I woke up at 9:00 in the morning it was still 7:00 in the afternoon so now I have days where I would wake up before my alarm for work just because I'm terrified that I might miss work and get in trouble I have to set an alarm for even more things than I did before so I can have some reassurance that I am not feeling at my job because I can't afford to lose it.</p>

Name	Jessica Iverson
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Even more time home alone and resting than participating in society. Communicating with healthcare staff to get needed care, including diagnosis and treatment. more brain fog from chronic pain and fatigue, symptoms of many if not most physical health conditions.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Regular treatments and therapy are not as helpful or accessible for people with autism. It is logical that someone with autism or other condition would also experience depression and anxiety due to social stigma and bullying. And doctors over diagnosis anxiety and depression instead of investigating whether autism and/or ADHD may be the source of difficulties especially in women. They tend to want to prescribe antidepressants and anti-anxiety medications instead of stimulants that are proven to help ADHD which would then help the depression and anxiety. The medication shortages have caused ADHD people to quit or be fired from schools and jobs due to lack of medication.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	People with higher support needs are often labeled as having an intellectual disability simply because of their lacking communication skills.
What additional research is needed to help address co-occurring conditions for autistic people?	What therapies and medications help people cope with being autistic and other co-occurring conditions without forcing them to mask their symptoms. Why some autistic people aren't able to mask their symptoms even if they wish to. Diagnostic assessments that are more accurate. How abilities and needs change over the lifespan.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	If mental health therapists and psychiatrists screened for autism and ADHD symptoms and were better trained at recognizing it in patients. Insurance coverage of assessments and therapy options for all ages. More sensory friendly doctors offices and hospitals. More therapists that focus on addressing the needs of the autistic person as opposed to conforming to make things easier for family, school, and society. If someone is diagnosed with autism, all family members should be encouraged to be screened as well. more accountability and higher paid, better trained staff at schools and residential facilities for people with higher needs. More education around and access to augmentative and alternative communication for all autistic people especially higher support needs and nonverbal autistics.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID affected those with physical health conditions that occur with autism, such as long term effects on mental clarity, migraines, respiratory and digestive systems. It also greatly impacted people with mental health conditions, either worsening pre-existing conditions or triggering new ones including agoraphobia, anxiety, depression, and OCD.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	COVID-19 caused increased isolation and worsened mental health in autistic people more than the average person especially due to difficulty adapting and lack of access to supports, consistent schedule, access to healthcare, and medication shortages.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
--	--

Name	Jessica Mullaney
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Joint hypermobility (i.e. Hypermobility Spectrum Disorder or Ehlers Danlos Syndrome) occurs more frequently in individuals with ASD than in the general population. The chronic pain and mobility limitations caused by these conditions can negatively impact mental health in individuals with ASD, as well as their ability to access needed supports in the community.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	A lack of understanding in how to accommodate these challenges in the workplace, leading to unemployment or underemployment of individuals with ASD
What additional research is needed to help address co-occurring conditions for autistic people?	A greater understanding of the links between ASD and conditions like joint hypermobility leading to better treatment options would be helpful, but the biggest issue is lack of awareness among healthcare providers currently. (It's great to do research, but if that information is not widely known by the people that individuals with ASD are seeking help from in a healthcare setting, then it doesn't do much good from a practical standpoint.)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Patient-provider interactions could be helped simply by a greater awareness of co-occurring issues on the part of healthcare providers. I went undiagnosed with Hypermobility Spectrum Disorder for 38 years because healthcare professionals incorrectly assumed that my complaints were psychosomatic, due to my co-occurring ASB and anxiety diagnoses. Ultimately, I had to learn about this condition on my own and ask to be evaluated for it, rather than any physician identifying it, largely because they failed to take my complaints seriously. This led to significant medical trauma and needless suffering for many years. Sadly, I have heard similar stories from others with these conditions. We can do better.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	A high percentage of those in the Covid-cautious community are neurodiverse and/or diagnosed with ASD. When the medical community decided to "move on" even though Covid has not yet moved on and abandoned Covid precautions like masking in hospital and office settings, many Covid-cautious individuals, including those with ASD, were forced to start forgoing medical care whenever possible for our own safety. The long-term implications of forgoing preventative care can't be good, so the failure of the medical community represented by them giving up on Covid precautions is highly unfortunate, harmful and, frankly, ableist.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	See response to previous question. The medical community's decision to abandon Covid precautions has led to some autistic people being unable to access needed care. We can do better.

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Jessica Phillips
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son is almost five and around 2/3 he was struggling with waking up 1am and want to start his day. Along with food diversions and will only eat limited food along with temper tantrums that can last two mins to thirty.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	He has a lot of aggression due to not being able to communicate his needs
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	He has social and emotional delay he has a hard time with his peers of his age. He tends to not want to be in unfamiliar places such as grandmothers house
What additional research is needed to help address co-occurring conditions for autistic people?	We need more people to provide services to special needs kids in sussex county.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My son has regressed in what he has learned when time has been off and unable to receive support

Name	Jessica Smith
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	SPD (sensory Processing Disorder), Gastrointestinal disorders (sometimes caused by the trauma we get being autistic living in a world not designed for us) theres some research that being autistic effects us all the way down to how we breath, we could be breathing wrong a not even know it.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	BPD, CPTSD, PTSD, PTED, anxiety, depression, adhd. there are so many its almost hard to not list almost everything. phobias, fears, OCD, bipolar, (yes i have all) eating disorders is HUGE, they are all horrible. theres not really one is worse than the other they all play a huge role in how it effects us.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	learning disabilities. some people dont understand the differences between autism and learning disabiliteis and will treat us as if we are trying to cause problems when we just learn/ process/ understand not just diffrently but at a diffrent time line. For me it takes me a lot longer to grasp concepts but once i get it i get it. aullistics and neurotypicals loose thier [profanity redacted] if i eed longer than the time THEY would need to understand something. and then say we have beveral problems just cause they are projecting how they would understand something onto someone else. like mainly its how others react to our learning disability/ intellectual disabilities than it actually being a problem. as well as communication. autistic/ neurodivergent peole might use a form of communication called anecdotal communication. neurotypicals do not use this style of communication and accuse us of 'one upping' them in conversation when we are just trying to prove we relate, understnad, and empathixe and sympathize with thier story. but we are forced to not use that style of communication cause THEY feel uncomfterbul with it and try and change us to lacate thier feelings of uncomfternility instead of actually understanding diffrent communication styles exist.
What additional research is needed to help address co-occurring conditions for autistic people?	Listen to autistic researchers. stop going to aullistics for understanding us. They will never be able to ask the right quetions cause they do not have our disability(ies) they do not struggle with what we striggle with, they do not understand it the way we do. and they are not only truamatizing us but making living in this world so much harder. listen to autistic researchers, realize that one way is not always the right way
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Have autistics and neurodivergents be the main staff for autistic and neurodivergents in any setting. if you dont have the neurotype, disability, ect then they should not be helping us learn how to handle it. for the love of all things cute and fluffy END ABA or at least staff it with people who are actually trained and have overcome these issues so we can actually help autistic children navigate this world. instead of putting people in there that might never comprehend our neurotype thus forcing us t behave in ways they see as appropriate/normal instead of the children learning proper ways to handle their disability. A lot of autistic/ neurodivergents view allistics/ neurotypicals the same way they view us. strange, weird, extremely rude and struggle with the concept of empathy.

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>i just like not always having to go in person. I wish there were more text services so i didn't have to call in or talk over skype (its strange and an invasion of privacy) i also dont like being precieved so having to be on camera, without a script, is horrid. there should be more remote work, more work done from home. ike no one really needs to be in the office and going to the office having to deal with a toxic work environment is not healthy for anyone. most if not all jobs can really be done from home and forcing us to go back into work is a living hell and causes a lot of issues. also school can be done from home as well, i get doing a test on site, but school work. like i learn better on my own anyway. i like having a teacher there for questions but id rather self study than listen to a teacher drone on for hours. plus student to teacher ratio is always off so in a classroom theres no time to ask questions and we usually get made fun of if we do, so id rather just type it to my teacher and get help that way then when they answer my question go back to independent study.</p>

Name	jewel brobst
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	depends on the day. (allergies can play a big role in some of the things i experience and how my body developed in incubation and growing up) but from say a scale on 1 (low) to 10(high) they tend to be around a 5 or 6.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	getting out of bed somedays. being able to calm my mind enough to sleep, the aggressive or self injurious behaviors for me happen during melt downs (that i have made categories for based on how they affect the people around me mostly but also how long the recovery time and how long / bad they normally are. these behaviors tend to happen in the 3s and 4s (higher ones) the suicidality is off and on with how bad the depression can get, very bad after bad melt downs (often caused by conflict) and i have to be able to bring myself back up from that low point and say their are people on this planet that still need me. depression & anxiety (same scale as before) from 1 to 10, lately is around a 4 or 5 adhd tends to be around that 8-10 (contributes a bit to the anxiety as well)
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	when i was doing in person schools. the fact not everyone believed I had my adhd, autism, and other learning disabilities. having many of my teachers not believe me meant that i wouldn't always get the accommodations that were in my iep or get new ones added. (yes i know illegal they still did it) i have 2 (both very similar) which put back my math and reading (what the state tests us for) which almost very easily could have put me back a few years in my learning. communication which is another thing i personally struggle with, effected my social life in school. having a small group of friends was better for me but we sometimes had a hard time understanding each other due to us all being neurodivergent and in diffrent grades. having friends in diffrent grades and not being able to make friends with those in a younger grade then me ment my friend group kept getting smaller. as well as having communication problems as in but not limited to: not understanding socail situations, social cues, hints, sarcasm, joking, body language, you get the point. having these problems makes it hard for me to understand and socialize with people not just my own age but people older and younger then me. more so if they dont understand why i stim, repeat words, figit, cant stand still, relate a story back so they know i understand.
What additional research is needed to help address co-occurring conditions for autistic people?	understanding that it may look like 1 person has 20 problems but 15 of those relate back to autism. understanding that as a autstic(spelled the way i normally spell it. idk why it says its wrong sorry) person you may have to get people to understand that what you have isnt just autism. in my 9th grade health class that was 1 semester long (half of a school year) we learned about depression, anxiety, some other common mental health problems, drugs. i feel like autism and adhd and some of the co occurring conditions should be added to that due to a kid might go their whole life thinking their just a bit weird and geitting bullied and having no idea why and never find out their autstic unless they go online or find someone who knows they are and relates to that. just make autism and its co occurring conditions normilized please

<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>maybe suggest to more insurance companies to cover tests. make the accessibility to services more known, like what we can get what we cant, what is around.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>both good AND bad. bad because during it i couldn't socialize with the friends i had made. (lots of ties that i NEEDED broke.) cant function as well as i could before. (basically i hid everything that made me autistic and after covid i couldn't shove it back into that bag.) good things are that many of my local stores do online shipping, and curb side pick ups now. meaning i dont have to wear sunglasses and earbuds when going in stores to HELP dull out the bad sensory (bright lights, crowds of people, and louds sounds msotly) and possibilty get asked why i need all of this. (or pay for sunglasses that have my prescription because i need glasses) so over all, things came out decently well, my mental health suffered like i seen alot of peoples mental health suffered. (and yes this goes for alot of my co occurring cuz they are all tied together)</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>we stopped wearing masks. i dont care i kept getting myself sick. i didnt have to express my thoughts or feelings on my face. now i have to AGAIN its annoying. the incress remote school given i got into the right one isn't fully negative. showed me their were other options i could do. for a long time i couldn't see my friends, even after the "dust settled" due to their being a stigma around having flu or covid like syptoms. (which i have year around due to allergies)</p>

Name	Jill Escher, National Council on Severe Autism
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Many in our severe/profound autism population suffer physical pathologies that can severely compromise well-being, to the point of being fatal. These include catatonia, epilepsy and seizures, gastrointestinal distress, insomnia and sleeplessness, and sensory overload. These pathologies can be ruinous to quality of life for the individual and family. They cause suffering and often, premature death.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	In our severe/profound autism population, behavioral pathologies are pervasive and can severely compromise well-being, to the point of being fatal. These include aggression, self-injury, property destruction, pica, and elopement. Aside from death, common consequences include bruises, lacerations, scarring, broken bones, ripping out of hair, and skin infections to both the afflicted individuals and their caregivers. Repeated self-injury can cause detached retinas, cauliflower ears, and traumatic brain injury. Pica can cause our children to ingest lightbulbs, rocks, toys, soap and countless other inedible objects. These are more than "challenges," they are lethal or traumatic injuries that often require emergency medical treatments, surgeries and complicated, costly hospital stays. Not only are these behaviors traumatic for the individual, the family, educators and caregivers, they often result in the need for emergency medical treatment, crisis and inpatient care, and residential placement. This imposes enormous costs on families and care systems. Reducing the frequency and intensity of these pathologies should be a preeminent goal for autism treatment and research, as they can result in death or further serious disability.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	In our severe/profound autism population, autism is in part *defined* by severe functional and communication impairment, so it is unclear why the NIMH considers these to be "co-occurring" conditions. Our population's functionality and independence is severely compromised by pervasive communication impairments, typically involving no or minimal language, and cognitive impairments so severe that they prevent any chance for independent living or meaningful employment.
What additional research is needed to help address co-occurring conditions for autistic people?	A top research priority for our severe/profound autism population is the alleviation of distressing and too-often fatal behaviors of aggression, self-injury, property destruction, pica, and elopement. There is a desperate need for more efficacious medical and behavioral treatments, and of course more understanding of routes for prevention. We need more research on: psychiatric medications; electro-convulsive therapy; other brain-activity modifying therapeutics such as TMS; and behavioral/sensory approaches. Much more emphasis must be placed on the needs of adults who often lack access to appropriate care and whose dangerous behaviors cause enormous burdens to families and care providers.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance, both private and public, should cover both outpatient and inpatient care for behaviors associated with Profound Autism. A new insurance code should be created to correspond with these clinical impairments (eg, aggression, self-injury, pica, elopement, property destruction), and treatments must be recognized as medically necessary under mental health parity. With urgency we must foster a much larger and more robust network of care providers in all states to address the care needs of this rapidly growing population. In addition, many suffering with severe

	<p>and profound autism require a therapeutic model of long-term residential living with onsite or collaborative psychiatric and medical care. Medicaid and other funding should directly and realistically address the needs of those suffering with the most severe forms of autism.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The Covid shutdowns have had a lasting devastating impact on programs serving individuals with severe and profound autism. Many programs, particularly those serving high-needs adults, have shuttered, leaving many adults almost completely isolated with no access to day habilitation or community engagement. We also believe that the federal government should take action to facilitate the use of tele-health across state lines. At this time, many regions are not served by autism specialists and their only hope for reasonable treatment access is through tele-health.</p>

Name	Jill Ide, University of Washington Autism Center
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	for my son and most of the people I serve, it is sensory challenges, followed closely by sleep disturbances, and then gastro disorders.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	communication disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	unsure
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	service system issues
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	reduced in-person social interactions and obligations

Name	Jim MacNaughton, parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has a high level of anxiety in part due to his life experiences through ASD and the world around him. He is constantly learning (and re-learning) the unwritten social rules.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For our son, it is definitely anxiety, which makes it harder for him to interact with others. He also has dyspraxia and ADD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	communication - his ASD and dyspraxia creates a frustration with him, which creates behavioral concerns. He often communicates through his behavior.
What additional research is needed to help address co-occurring conditions for autistic people?	anxiety reduction.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Schools moving to virtual model created a large socialization learning loss in our son.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Negative: Disruption in social learning via the virtual model.

Name	Jimee
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory & motor challenges. Sleep disturbances. Additionally UTIs and incontinence due to interoception difficulties. **Dental issues from executive functions struggles.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD (all types) Dyslexia Especially in girls: depression & anxiety from misdiagnosis and/or from internalizing struggles
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Especially in girls: Speech Impairment can be only diagnosis given by public schools if any giving young girls access to special education services...but not all that they need. Dyslexia (can be compensated at young ages at the expenses of individual) Personally I was *lucky* to get an ADHD inattentive type diagnosis in the 90's. My IEP also supported my gross and fine motor delays.
What additional research is needed to help address co-occurring conditions for autistic people?	Research in AFABs!!!! Continuing research on how ASD presents differently in all individuals! The DSM-5 doesn't support women or other minorities... More training for providers on MASKING and compensating (which can be in boys as well as girls)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to Providers that are well trained in the research surrounding Autism in AFAB & minorities! So they aren't given inaccurate diagnosis. My late grand mother was treated for Bipolar Depression when she was Autistic!! This would have alleviated so many of her depressive symptoms!!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Thankful for telehealth. This makes mental health care more accessible and accommodating. Also the ability to work from home. This helps so many autistic & adhd individuals do quality work and lesson risk of overstimulation and burnout
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Postive: Remote work Telehealth Online scheduling Reduced unnesesary social obligations No contact deliveries Negative: Denied access to safe and prefered or established providers due to covid scheduling

Name	Joanna
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Poor sleep , general crippling anxiety , poor diet , sensory issues such as struggles bathing and hygiene , changing clothes , brushing teeth . My boy has PDA which should have its own recognised profile under the ASD diagnosis as it has its own set of traits , these traits to manage need different strategies than an individual with ASD alone . Professionals are not aware of PDA even in SEN schools which makes our kids unable to manage in mainstream or SEN schools and parents have to home Ed instead .
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Generalised anxiety , extreme responses to frustration due to ADHD , makes him aggressive . His PDA and anxiety makes it hard for him to leave the house and experience new things . Poor self esteem , extremely attached to care givers . When overwhelmed it can take a long time to calm down and due to the panic attack he is exhausted the day after . His nervous system disorder (pda) makes every day asks turn into a fight / flight response . Managing this is extremely tricky as other ways of parenting , rewards , punishments do not work but upset him more .
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication , speech delay , poor understanding of how he feels , very black and white understanding of emotions which makes it extremely difficult to understand how he's feeling and for us to understand how he is feeling . Can't have a 'normal ' conversation 2 way as he only talks about what he wants too and doesn't listen to others opinions . Interrupts , talks over people . Also selective mutism due to his anxiety and social difficulties. PDA means asking direct questions turn into a demand and his nervous system gets triggered .
What additional research is needed to help address co-occurring conditions for autistic people?	PDA needs to be recognised and diagnosed alongside the autistic assessment . It is a specific set of traits and relatively easy to spot from a young age . It would help parents get support and SEN schools to use a different approach to these kids . Autistic kids without pda have a different set of needs , PDA needs to be identified and recognised to enable our kids to receive actual support and access SEN schools they have an entirely different approach to allow our kids to thrive . Parents must stop being blamed for professionals not understanding their kids needs . Parents have to research and understand their kids themselves in order to get any kind of support . As PDA isn't recognised parents receive damaging advise on how to handle these kids that absolutely doesn't work . The system needs to recognise that pda is very real and unlike other profiles . Parents and kids need support not blame . Education for professionals is key , CAMHS needs to identify and diagnose PDA profile .
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Faster assessment times for kids with a diagnosis already of ADHD or ASD so parents don't have to struggle . More thorough OT sensory assessment through NHS so parents don't have to pay private to access their kids sensory needs . Access or an option of insurance to access private therapies , more access to play therapists . For paediatrics to recognise anxiety in children and to help parents to help their children without assuming the parents are to blame . autistic kids need more therapy options in general .
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My child loved Covid as everywhere was quiet so he felt more comfortable accessing the outside world . For others I understand Covid will have had a negative impact effecting their daily/ weekly routines and they will have felt trapped .
What lasting positive or negative impacts have societal changes due to	Assessments through OT on NHS were done via phone call and the outcome was underwhelming and very poor . May aswell have not bothered .

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Joanne Miller
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Professionals often do not see beyond the autism diagnosis to consider any other medical condition/issue that the person may be experiencing. Professionals often attribute any physical health condition to "autism" and do not spend the time or effort to listen to what is occurring.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Professionals do not see beyond the autism label. They attribute any mental health condition to being part of the autism diagnosis, instead of looking at the person from a holistic viewpoint to consider all variables that may be interacting for the person.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	If a person with autism experiences issues with expressing themselves/is non-verbal, people assume they aren't intelligent, which is a false assumption, and write off anything they might say/do as "being a part of the autism". Many, many people with autism might not communicate verbally, but do use other forms of communication to relate to others. People who are not skilled in this or don't take the time to learn how the person communicates is not listening to the person.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Training on all facets of autism - from behavioral challenges, to communication methods, to simply "how do I interact with this person who has a diagnosis of autism", because if I've only met one person with autism, I've only met one person with autism. Insurance coverage needs to be beefed up to cover trainings and therapies for folks, and there need to be more providers who will serve the folks with the most profound disabilities, those who do require 24/7 care for the rest of their lives. We don't have enough qualified people for that very urgent need.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Joanne Van Hoosear
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor challenges: sensory challenges that impact movement and balance, interoception. POTS: Dizziness, heat sensitivity, impact on self care when standing in shower is so exhausting. Ehlers-Danlos: Joint pain and needing joint replacement at a young age
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological demand avoidance: this presentation of autism is not well understood and not a recognized diagnosis in the US. Especially given that typical approaches that are effective for many autistic folks can actually worsen PDA responses, this is an important area for study.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage for supports other than ABA.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	A positive for autistic people is the greater availability of remote work, schooling, health care, etc.

Name	Jobless autistic
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GERD, gastroparesis, insomnia, POTS, epilepsy/ photosensitivity, sensitivity to stimuli, lack of balance, difficulty reading and writing, polyneuropathy, costochondritis/ tietze syndrome, slipping rib.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, bipolar type 2, BPD, ADHD, PTSD, C-PTSD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Difficulties in communication, learning disabilities, uncontrollable extreme emotions, sensory struggles like overload or sensory seeking, stress induced seizures, constant burnout
What additional research is needed to help address co-occurring conditions for autistic people?	In general I don't think autism is researched enough, but I'd love to see research into the full capabilities of autistic people in childcare so we can adopt since we're already allowed to have our own kids by childbirth. I'd also like research into helping us at jobs and in the education system so we can get support because 60% of us are unemployed including me. I apply everywhere and can't get a job because I'm disabled and autistic.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My social anxiety has gotten worse, I'm slightly agoraphobic now, I'm suspicious of everyone because it's like a long game of clue since I'm immunocompromised and therefore almost constantly sick, I'm mad at people for not wearing masks, I'm getting less exercise because of it and my physical health is suffering, and my depression is up because I'm trapped inside or else I'll get sick even with the necessary precautions
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My final year of high school was disrupted, and so was my graduation. I had so many plans that year that never got a do-over because of covid-19 and it was really hard for me because that was my plan/ schedule! I also unmasked my autism while at home and now I struggle to put the mask back on. In some ways I don't even think I can mask again.

Name	Jody McCormick
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges I face is sensory overload. Being in a crowded space where there are a lot of different things happening around me often requires intense focus to be able to do the simplest of things. For example, when checking out at the grocery store all of the "boop"s of the scanners around me, the mom in line behind me trying to keep her kids from touching all the candy on display, and the facial expressions of the cashier... I notice all of them and more along with the thoughts they all produce in me. Why that *specific* "boop" sound? It certainly cuts through the noise. I'm sure that's why. Wow, being that mom right now looks hard. I remember being a kid in line and wanting some reward for not eating the blackberries I saw back there. I wonder what the cashier looks so aloof to it all. She's underpaid. The economy will probably get better eventually... All of the sights and sounds around me produce full-fledged, in-depth, internal discussions that I have no control over. My brain cannot cut the unnecessary connections between neurons as easily as others'. Getting through all of that sensory information to realize that the cashier is now staring at me because I haven't pressed "The Green Button" on the card reader can be very, very difficult.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	All of the above. From my family and friends to my bosses and coworkers, it can be extremely difficult to communicate effectively with them and feel like I'm being correctly understood. It's isolating. I'm not anti-social because I don't want to be known. I'm anti-social because I need to be known. I'm just usually the only one can. But I'm still human and still need real connections with people. Not being able to really have that without hiding myself by mirroring the speech cadences and, as closely as I can, the thought patterns of who I'm interacting with so that I can even somewhat be heard -- is tiring. It's so easy to get depressed and to feel so very alone when you have to constantly adapt yourself like that. Any excitement from getting to know someone or being in front of people can quickly turn to anxiety when you know that sooner or later something you will say or do is not going to mean what you thought it would to them, because you simply do not have the same toolkit for the way you cognitively process information. The consistency and pervasiveness of that experience is, well, depressing.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities. Hands down. I have learned that no matter how articulate I am I can never distill what is in my mind into words. What I see through the lens of my autistic brain almost never correlates directly with any word or phrase in my vocabulary. So I just try to get as close as I can. Imagine you're on the 20th floor of a building overlooking a crowded street below you. In the room with you are a 24in by 48in canvas, one fine-point brush, various paints in small bottles, and one person you know. The person, unable to come to the window, asks you, simply "what is going on out there?". You get one color for every word or phrase you know and as many strokes of your fine-point brush as the person with you has patience -- and they get to ask you clarifying questions while they watch you painting. The only thing you're allowed to say to them is "that's not really what I meant" and must adjust your painting accordingly to answer any questions they have about it. That. It's like that. Over time, you get better at it, but still. Communicating is hard.
What additional research is needed to help address co-occurring conditions for autistic people?	With the proper accommodations and support, autistic people can add truly incredible value to organizational goals. However, the typical expectations set in a working environment hinder us from being able to perform at our best. I have worked in many industries and by far the most accommodating and

	<p>supportive working environment I've experienced is in the software engineering space. Companies in that space tend to be much more flexible with time off, more understanding of the need for autonomy, More research is needed at a national level to assess what accommodations and what strategies are effective and what are harmful to people with autism in the working environment -- as well as the real impact to GDP provided by investing in effective accommodation and support strategies for people wherever they lie on the autism spectrum.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>* Regulations to reduce sensory overload from advertisements, especially when advertising to children * Regulations to effectively eliminate any practice employed by producers of any form of digital media (i.e. video games, applications, digital devices, music, video, etc.) that are specifically marketed to children, of utilizing the mental or cognitive disabilities (including, but not limited to, those that are co-occurring with autism) for the purpose of monetary gain. * Federal protections for taking "mental health" days off of work to protect the mental health of employees diagnosed with autism * Metal health service coverage should be considered as necessary care (both as preventative care and as treatment) and be required to be covered by both private and publicly funded insurance providers. * Educational reform to better address the social and interpersonal challenges faced by children on the autism spectrum to provide equitable access to education for all children in the classroom.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	

Name	joe valenti, parent advocate
Demographic	Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenge for those in this category is the behavior challenges which occur. The staff training and education in the needs of those with co-occurring conditions is lacking with community providers.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Attention-deficit hyperactivity, self-injurious behavior, hurting of others. Our state has an interdisciplinary team which coordinates care which is not available in the community.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	all of the above especially for the most profound. Behavior.
What additional research is needed to help address co-occurring conditions for autistic people?	I believe CMS needs to understand one size does not fit all. We seem to think about autism with high functioning individuals. The individuals at the higher level of the spectrum have much different needs. More feedback from parents/ guardians
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	education and training. And then appropriate funding from the state and federal Medicaid.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	In some cases, they have become more isolated. Less social
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I believe individuals have become more isolated. I also feel it highlighted the significant staff shortages in the provider area.

Name	John
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	In addition to ASD, I also have ADHD, and find it very difficult to fall asleep & stay asleep, which result in lower energy and emotional regulation during the day.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have late-diagnosed (aged 49 years) ADHD & Autism, and significant monopolar depression. In the past, I have had significant challenges with executive function & emotional regulation, which I know has caused trauma for both of my children. Since my diagnosis, I now have the tools to manage my emotions, and am working to heal both my trauma, and that of my kids.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The ADHD, that I did not know I had, significantly impacted my education. Had I been diagnosed & accommodated, I suspect I would have performed significantly higher in school, and may have pursued a more advanced degree & career path.
What additional research is needed to help address co-occurring conditions for autistic people?	How businesses can better accommodate & include/reduce stigmatization of ADHD-Autistics in the workplace.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Protection from punishment in school & at work by non-autistics that do not understand the difficulties in communication faced by autistics. I have lost multiple jobs/promotions because bosses did not/could not understand my communication needs & style
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Reduced in-person requirements & fewer large meetings have resulted in a much lower stress level for me. Also, the emerging community of ADHD-Autistics that has grown on TikTok/Instagram would not have exploded without the impacts of the pandemic. There so many of us undiagnosed autistics who benefited from the additional time & space at home to genuinely evaluate ourselves & our interactions with others, leading to discovery of our condition, and allowing us to seek diagnosis & therapy. Without the pandemic, I would probably still be a burned out underperformer at work and in my relationships.

Name	John Collins, Mass General
Demographic	Family member of an autistic individual; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Finding clinicians experienced with profound autism, non-verbal. Coordinating care. Lack of research available on patients with profound autism with co-occurring health conditions. Lack of inclusion for profound autism people on public committees. Their challenges make participation nearly impossible, so they are ignored.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Getting through a day without injury. Having access to providers with experience with people with profound autism. Very few available. Lack of research on the underlying causes for profound autism and co-occurring mental health conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Daily life!!! Fundamental safety issues, all activities require support and supervision. Where is the research to help develop more technology to make daily life doable for non-verbal people with profound autism?
What additional research is needed to help address co-occurring conditions for autistic people?	First recognize that people with profound autism are NOT represented in research! Focus on this population that needs the most help...but cannot ask for it. What causes autism and GI and autoimmune medical conditions in people with profound autism? Why do they have more co-occurring conditions and that develop earlier in life? Why do states have such poor data on autism, housing for people with autism, medical care use? We need better data in order to plan/provide adequate medical care, housing, transportation, work/volunteer opportunities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Everything for people with severe or profound autism needs to be improved. This population is NOT represented by self advocates, and does not have a voice in research or policy. People with profound autism have been ignored and as a result none of their needs are being met in a systemic way in any state. National data do not reflect this group. This is an urgent request to include people with profound autism in all future research considerations.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Fewer opportunities for people with profound autism to be in the community. Insufficient staff has closed day programs and closed group homes, fewer jobs/volunteer sites. Families continue to be required to be home to supervise without support services. Need better supports for families, career paths for workers, training for staff and clinical staff working with people with profound autism, more telehealth, online healthy programs, alternative options for exercise. Have state universities open gyms and recreation facilities to these state residents for free use as part of a healthy living protocol.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	Need research on what lasting impacts these changes have had! Families of people with profound autism have experienced loss of income, restriction of activities/movement as they care for their loved one at home due to loss of services and programs. Research on families, higher rates of mental health

changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

issues for family members. Research on profound autism is urgently needed to answer all the questions asked in this request for comments.

Name	John Saito, Oregon Commission on Autism; Washington County Developmental Disabilities Advisory Council; Oregon Home Care Commission
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances and sensory challenges can interfere with and even prevent autistic people from engaging in valuable therapy sessions, medical treatment appointments, and day support activities intended to address their other diagnoses including autism. Losing eligibility for these services and having to constantly delay and reschedule them effectively reduces their efficacy.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, and unsafe behaviors all interfere with, delay or prevent use of valuable therapies and treatments, many of which are intended specifically to help alleviate these very conditions. Worse, many autism / IDD service providers are incapable, unwilling, and not required by law to accept autistic people with aggressive or self-injurious behaviors into their Medicaid-funded programs. This leaves the autistic individual insulated, and in greater danger of neglect or worse once their primary caregivers (parents) die.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	School and transition programs administered under IDEA / FAPE are not equipped to service people with severe / profound autism given their high prevalence of learning, intellectual, and other disabilities (usually equally severe). The result is an 18 year daytime respite program with very little value-add in key areas such as basic communication, social interaction, personal safety, and fundamental activities of daily living (ADL) skills development. Once such an individual ages out of IDEA/FAPE, adult programs for the underserved individual are all but nonexistent. In other words, I/DD social services are scarcest for those with the most significant needs.
What additional research is needed to help address co-occurring conditions for autistic people?	What are the drivers that result in the disproportionate amount of co-occurring diagnoses for those with a profound (level 3) autism diagnosis? What therapies and medications should be required mandatory coverage in Medicaid and private health plans for those with an autism diagnosis, given the higher likelihood of certain co-occurring conditions? What social service program enhancements (via Medicaid Waiver / HCBS) should be made to better address the comorbidities that occur most commonly with autism (especially those with severe / profound autism)?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Medicaid Waiver funding should be contingent on requiring a state and its counties to guarantee accessible and appropriate capacity to residential care facilities, adult day programs (enrichment, recreational and employment), and in-home caregiver programs that must accept and support autistic people with co-occurring mental health and behavioral control issues such as self injury and aggression.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to	

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	John Yacks Jr.
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest challenge is communication and management. Dietarily speaking, it is incredibly problematic to break bad habits or even have a desire to change, because at our core hate change.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For me, I was very dependent on my mother. I didn't feel comfortable with being around new people or even getting help. I felt I didn't want to say the wrong thing.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication and understanding. I there has to be an understanding that we need the care to be explained concretely.
What additional research is needed to help address co-occurring conditions for autistic people?	Further behavioral and mental health research could be done to see how issues and policies that were in place, like the pandemic, would be beneficial
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I think more consideration could be given to the fact that virtual visits and telehealth aren't the same as being in person. I have cases that I manage where the provider won't hear what my member has to say half the time.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I have PTSD from having to isolate. I have resentment in my heart for a government that deliberate turned a blind eye to how all this could have been avoided. I have no faith in anything that is being done at a federal level. Physically? I have had COVID 3 Times while being unvaccinated and vaccinated and I don't feel any different. I can still walk talk and breathe like it never happened.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I can't ever be the same. What semblance of normalcy I have now is really the only thing keeping me from destroying myself. It would wreck my soul to have to go through that again.

Name	Jonathan Fratz
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As someone who could not speak when I was younger, it was difficult to explain to caregivers and medical professionals that I was having issues with sleeping and eating as well as facing sensory and motor challenges. I still struggle to this day with these issues, which have impacted my quality of life and my ability to be among my peers and community. I have co-occurring physical health conditions such as scoliosis and hypopituitarism. Some of the symptoms are fatigue and muscle weakness. It is difficult to get others to understand that when I am tired, it is not because I am being lazy or that due to my autism, I am not following social norms and behavior when in public. My physical health conditions are also overshadowed by my autism as I have difficulty explaining what I am feeling or having issues with, which can make my conditions worse or left untreated. It was a challenge for my family to find medical professionals who understood both autism and could treat co-occurring conditions.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	As an autistic youth with ADHD, I suffer from anxiety and depression. I receive support from a behavioral aide in school due to aggressive behaviors that I had in the past and my inability to initiate and complete tasks. Being autistic makes it difficult for me to express myself and my feelings. I still have difficulty being understood by mental health professionals in both the school and medical communities. My co-occurring mental health conditions are underestimated, and their symptoms are incorrectly associated with being autistic. It was a challenge for my family to find medical professionals who understood both autism and could treat co-occurring conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I was nonverbal until the age of 6. Being nonverbal and autistic presented many challenges for myself and my family, as well as accessing and utilizing supports and services from the school and medical communities. It also made it difficult to be among my peers and to be understood, which only increased my anxiety and depression. I have auditory processing disorder among other conditions, which still makes it difficult for me to understand what is communicated to me, which further complicates the things that I can do and how I interact with everyone around me.
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be research in establishing better practices to address co-occurring conditions in autistic people, particularly children and youth in receiving diagnoses and accessing services, as well as establishing guidelines in how medical professionals serve autistic people by addressing those co-occurring conditions without placing their cause under the scope of autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autism services and supports could be improved by providing more training to medical professionals in how to address co-occurring conditions for autistic people, improving accessibility of services and supports from medical professionals that already have training and expertise in providing care to autistic people with co-occurring conditions, and providing training to increase positive patient-provider interactions in which autistic people feel seen and heard when it comes to communicating their needs, concerns, symptoms, and treatments for their co-occurring conditions. As an autistic individual, I have experienced not having my symptoms being taken seriously because they were viewed as an extension of my autism and not my co-occurring condition.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	In the winter of 2021, I was infected with COVID and had to miss school for a month. As an autistic individual, I already had difficulty socializing with my peers, which was made even worse through the need to social distance and attend school via virtual learning. I was attending a new high school virtually

	<p>and being sick delayed my return to campus. This negatively impacted my mental health, increasing my anxiety and depression, and making me feel even more socially isolated. In addition, I suffer from asthma and other physical conditions that were also negatively affected by my having COVID. I feel that my mental health never really recovered from the impact that COVID made, during the lockdown and when I got sick. I did not have access to my supports and services during COVID, including physical access to my behavioral aide. I had to interact with them virtually, which did not really help. I have severe anxiety and high level of frustration. The pandemic only made my anxiety worse. I received virtual services from my school psychologist, along with support from my family and therapists at home, but it was an extremely difficult time for me.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Telehealth and access to virtual appointments have been some positive impacts that the pandemic had on the physical and mental health of autistic people. Unfortunately, a lot of people like me never recovered from the disruption to supports and services that occurred during the pandemic. I depended on those supports to be a part of my school and neighborhood community and their disruptions put me further behind, both socially and academically, compared to my neurotypical peers. The reduced in-person social interactions made me feel even more socially isolated and hampered my ability to develop my social skills, skills that I need to depend on to navigate my community as a youth and that I need to develop. My depression and anxiety increased, and I never returned to the levels that I was before the pandemic.</p>

Name	Jonni Jordyn
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I'm highly masking which delayed diagnosis of my gender dysphoria for decades. I think my educators recognized in the 60's that I had (at that time) Asperger's syndrome, but not my doctors. I also remained undiagnosed for Ehler's Danlose despite many dozens of sprains and a recommended operation to shorten some ligaments. My autism mostly manifested in positive traits, gifts, but I do suffer from sensory overload and lack many social skills like the ability to recognize non-verbal communications.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My therapist has not related my anxiety with my autism, but I started suffering migraines at age three (although my physicians never actually admitted they were migraines until age twelve. They told us children don't get migraines because they are related to adult pressures.) My migraines had two main triggers, mint, even just the smell of a candy cane, and anxiety. The day before every new school semester would come with a migraine. I learned on my own how to recuperate from them by age eight and nearly eliminated them by college (through relaxation techniques.)
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I had no learning disabilities, in fact, I had just the opposite. My teachers never advocated skipping me ahead due to my social issues (of which I was completely unaware) but they did send me up for specific classes like math, english and sciences. My gifts are in creativity and logic, which paved the way for music, acting, writing and computers, when they became publicly available.
What additional research is needed to help address co-occurring conditions for autistic people?	There are so many co-morbid overlaps. I think the relationship to ADHD is well recognized, but other overlaps with Ehlers Danlos (connective tissue) need more research. This connection can be important for medical treatments, for example, before I had braces installed on my teeth, I forewarned the orthodontist that she may see some differences and her whole office is amazed at how quickly my teeth moved into place. Treatment options could be modified if these relationships were better understood.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	First, remove the stigma related to autism. Having an official diagnosis can follow a person around and may even prevent them from moving to some countries. Second, training to recognize that not all autism patients are non-verbal. Highly masking individuals with genius IQ's may also need mental health care to diagnose co-morbid conditions earlier in life.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I'm unaware that covid-19 had specific connections to autism or mental health. I've had two cases that were so mild, I had NONE of the classic symptoms (I had all my vaccinations.) I'm seeing my therapist today and will set her on the hunt to learn about these.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Although I had been noticing personal traits that were on lists of autism symptoms for decades, the quarantine period freed me to start questioning these with my therapist. As a well compensated technologist, I was able to perform all my duties remotely. I never suffered the shut-in symptoms that others have, possibly because I'm less social, in which case autism was a boon.

Name	gorja harper schall, OHSU lend
Demographic	Autistic individual; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Schizophrenia anxiety
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Schizophrenia anxiety self injuring
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Development disability
What additional research is needed to help address co-occurring conditions for autistic people?	Housing group homes
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Housing group homes institutions
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Anxiety getting out
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Loneliness

Name	Josephine Weber
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Attending to task. My sons OCD like tendencies interrupt the smallest tasks. This makes getting through the school day very hard and increases anxiety.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The anxieties that come along with ASD often result in impulsive behaviors that make it difficult to interact in the community and classroom. For example, an impulsive behavior my son has when upset is grabbing hair or flopping to the floor.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication. My son has words but we consider him non verbal bc he is non conversational. He doesnt comprehend things bc he is severly cognitively delayed and also has Apraxia. This means he struggles to interact w peers and adults. He spends most time alone or w adults. He does not get to lead a typical childs life.
What additional research is needed to help address co-occurring conditions for autistic people?	More genetic research. We have 5 boys on my dads side diagnosed w autism or learning disorders.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance needs to cover behavior therapy and additional services outside school. The service school gives (speech, ot) is not enough. Pay providers more! We need more quality providers. Revamp the special ed public school system. Pay the Aids!! Train the aids!!!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My son started school post covid

Name	Joye, service coordinator in HCS program
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	who wrote these questions? we don't say autistic people. the question should be, "how does autism affect someone's physical health?"
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	communication. being non-verbal doesn't mean that the person has nothing to say. being unable to make yourself understood is the cause of a lot of aggression.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	language must be learned in a group, otherwise, who will you communicate with? Isolating the person who cannot communicate by surrounding them with people who are unwilling to learn their communication styles is counterproductive
What additional research is needed to help address co-occurring conditions for autistic people?	teaching sign language to the entire community. what would happen if everyone learns basic sign language? Cultures already use sign language like, high five, thumbs down, middle finger, shake your fist. Then, put the people together who pick up on the sign language and let them have their culture. let them learn together. What would happen if there were dorms or apartments that cater to people who sign? people who can hear should not be prevented from learning sign language.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	people who have autism have the same need for counseling as anyone who is going through stress and trauma. Counselors are needed who accept clients with autism. Also, the question should be " conditions for a person with autism." (who wrote that?)
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Jude
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	As a 77 yr old neurodivergent woman with diminishing brain, due to 20 yrs paying financial, emotional, mental + social price for subsidiizing (lifetime undiagnosed) 77 yr old privileged white man. My naively/innocently/unknowingly/lovingly housing + feeding + tolerating his severe autistic dissociation which has disabled his ability to earn a living or to be father & grandfather -- his children's choice. Where cen he, where an I, get help? WE NEED HELP
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	EQ -- no EQ + his innate deep sensitivity has to be denied. my 77 yr old autistic partner of 20+ yrs his EQ -- lack of emotional quotient -- lack of ability to relate, or to see others, disables him from accepting reality and thus is unable to earn a living due to his self-protective ONGOING DENIAL of his disability of his never diagnosed somewhere on the spectrum.
What additional research is needed to help address co-occurring conditions for autistic people?	levels of lack of relatedness --- leading to fruitless dysfunctional (deeply denied painful) 77 yrs of life
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	understanding -- ACKNOWLEDGEMENT of some of the less overtly obvious -- but passively self-destructive life patterns which ripple dysfunction through a lifetime through familys and down through generations
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	more pressure on the 77 yr old autistic man of my references here apply to there being less empathy and understanding, less professional ability and time, and money within the mental health systems and social services here -- which of course are under huge ongoing pressure - to grasp the severity of autism for older people -- at least in my case for my 77 yr old partner whose brain -- like mine -- continues to deteriorate...AND THANK YOU ALL FOR CARING ENOUGH TO BE DOING ANY OF THIS IN THE DOMINANT POLITICAL SYSTEM FOR WHICH LOVE AND CARING OR ITS LACK -- COUNT FOR ANYTHING

Name	Judith Ursitti, Profound Autism Alliance

<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>Because people with profound autism can't provide written comments to requests like this, we've attempted to convey their experiences through caregiver feedback: GI "It's challenging to determine what will help your children when they can't tell you exactly what is happening with their digestive systems. We have been through several specialized diets & supplements & have finally settled on what we think is helping them, but both have struggled with chronic constipation." "They dismissed my concerns because he wasn't celiac, but chronic constipation during early development prevented potty training; at 14 years old, he's still in pull-ups." Sleep "My kid used to sleep for 4 hours every 3 days. Almost 30 years into this, she sleeps 4 hours daily, sometimes in several pieces. Staying up through her insomnia has been soul-shattering & brutal. My health has deteriorated, as I was left to monitor her during all waking hours plus figure out how to work while sleep deprived." Sensory "It is hard to find a dentist who will adapt to sensory & behavioral issues & if you need sedation dental work. My son went without for years, & then when we found a dentist, he had to get 5 teeth removed at one time due to decay."</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Because people with profound autism can't provide written comments to requests like this, we've attempted to convey their experiences through caregiver feedback: "Self-injury is so damaging to his body & mind. He will hit his head until his temples are swollen & blood vessels burst on the surface. He bangs the bridge of his nose & has created a bump. He has scars all over his hands, arms, & legs that are remnants of self-injury episodes. He picks his skin; he slams his hands to his chest; he has callouses from biting areas repeatedly; he has left me with scars on my hands & arms; he pulls hair so hard that my scalp throbs; he scratches, pinches, & is unpredictable. He has always had self-injury & aggression. However, as an adult, it is very life-altering. It affects services & his quality of life. I don't understand how services won't accept people with behavioral challenges." "Aggression towards others & herself- Biting, scratching, hitting, putting pressure on people with her hands or other body parts), hitting herself in the head, picking at her skin, bending her body into painful contortions, throwing herself down, using objects as weapons, breaking her teeth on objects, pulling out hair." "OCD - Constant ritual behavior, verbal ticks that must be completed, hoarding objects, shrieking at high levels at all times of the day & night if something doesn't go according to ritual, triggering violent episodes. Hand washing until she has severe eczema."</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>Because people with profound autism can't provide written comments to requests like this, we've attempted to convey their experiences through caregiver feedback: "Health care is generally difficult, so many adult providers do not understand how to interact or communicate with your children. My children are young adults now at 21 & 23, & they still struggle to tolerate basic medical exams--blood pressure cuff, otoscopes, thermometers, much less injections. Both boys have had to be sedated in the hospital to undergo what would normally be outpatient procedures: dentistry & dermatology, for example. My younger son just had to be sedated, which was a long, stressful process in the local hospital because the anesthesia professionals were not trained to work with this population. The reason? He needed to have plantar warts removed, which you would normally do in the podiatrist's office with a local anesthetic. My older son has a suspicious lesion on his scalp that I suspect is basal cell skin cancer, so</p>

	<p>we're getting ready to have to go through a similar procedure with a dermatologist. "Other issues, such as ingrown toenails or cavities, should be considered, too, since these are normally minor occurrences, but for someone who is non-verbal & doesn't communicate very well, they can lead to infections." "Prompt dependency gets in the way of authentic communication."</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Autistic people who require round-the-clock care throughout their lives experience unique challenges that warrant targeted research. Additionally, a renewed focus on the meaningful inclusion of people of all ages with profound autism in clinical research is critical, as currently, they are severely underrepresented. Specific areas of focus that would benefit those with profound autism include: Research specific to communication as it is currently minimal at best. Research focusing on intense behaviors that people with profound autism experience, frequently resulting in injury and isolation.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>To improve health and connection, it is critical that clinical practice guidelines specific to profound autism are developed and implemented. Additionally, enforcement of protections under federal mental health parity law should be a priority. Because people with profound autism can't provide written comments to requests like this, we've attempted to convey their experiences through caregiver feedback: "Every hospital that receives federal funding (all of 'them) should be mandated to have a designated ER & inpatient care coordinator on staff for all patients with ID (including profound autism) & other disabilities. It doesn't need to be a separate position. The role can be a (trained) regular staff member. Hospital rules & procedures may need to flex for various reasons to improve the quality of care for our community, & management will need to approve changes. For example, a caregiver in the room overnight, dispensing regular (Dr approved) meds, consolidating scheduled tests & procedures. "He can never ever ever be left alone. That doesn't sound like a big deal compared to the myriad of other issues we've faced in the past and that other families grapple with now, but it's pretty major when you're talking about 66-year-old parents and a nonverbal 38-year-old guy who would not be accepted at any of the nonprofit residential programs in the area and is still on the waiting list for the most appropriate community-based Medicaid Waiver funding."</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	

Name	Judy Stoltz
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has motor issues and apraxia His body does things that he doesn't want it to do Sometimes minor like pacing or making involuntary noises But other times dangerous like jumping in front of speeding cars or throwing object at family members or self injurious behavior like hitting his head again the wall or door-jam When asked what he wanted to tell the regional center at his annual meeting, my son spelled "AUTISM IS NOT A COGNITIVE OR BEHAVIORAL ISSUE, IT IS A MOTOR ISSUE. WE NEED PEOPLE WHO KNOW HOW TO COACH OUR BODIES" Not people who are trying to teach us to talk "I AM NONSPEAKING, I AM NOT NON VERBAL"
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For my son he is still learning to communicate openly. He has not communicated that he has depression , but he has been self injurious at times over many year, and occasionally been aggressive toward me/mom. He has spelled "IT DESTROYS ME WHEN I HURT YOU! BUT YOU HAVE NONIDEA HOW HARD IT IS TO BE IN A BODY I CANNOT CONTROL." The way autism is perceived is all wrong They are not mentally deficient In fact are some of the smartest people I know But they have been trapped in bodies that we dont understand What if we and by we i mean the entire system of schools, doctors, specialists, ASSUMED COMPETANCE
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I know know And any parent of SPELLERS know, But now YOU NEED TO KNOW there is not learning disability or cognitive issue, it is all motor issue Fine motor issues don't allow them to use sign language or writing or typing SPELLING moves their communication into gross motor and there are no limits what they can learn
What additional research is needed to help address co-occurring conditions for autistic people?	Study the motor issues, apraxia, dyspraxia, and assume competence
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	My son NEVER would have been referred to as cognitively impaired if experts were not worried about protecting their current standards The EXPERTS don't accept or acknowledge practices that would really help our autistic population Non speakers are graduating from high school AND COLLEGE Non speakers who the experts identified as mentally impaired As severely autistic As not being able to spell their own name Imagine if we all ignored ASL or Braille as a valid form of communication By denying autistic people communication partners and use of spelling boards, the EXPERTS are denying our kids and young adults the right to an education and a full life
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Lock down and isolation was not good for anyone But for an autism person who is also non speaking it was that much harder on them and their families
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	All of the above were an issue My son Had severe self injurious behavior with no social or physical stimulation Since starting to use SPELLING BOARDS, (only one yr ago) he has not yet spoken of his mental health, but he is no longer self injurious

Name	Jules Good, Autistic Self Advocacy Network
Demographic	Autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	We thank the IACC for the opportunity to comment. We note that given the importance of these issues, it is unfortunate that the submission format for this RFI significantly limits respondents' ability to provide thorough, meaningful comment. Please visit https://bit.ly/48eGZzO to view our comments in full, including citations. Difficulties during pregnancy and birth are a common issue for autistic people. According to an NIH meta-analysis of 13 studies on pregnancy experiences in autistic people, we are more likely to experience "preterm birth, cesarean delivery, and pre-eclampsia". Given what we know about Black maternal mortality, we can extrapolate that Black autistic birthing people experience these issues at an even higher rate. More research is needed in this area. Forced birth is known to cause adverse health outcomes, especially for disabled people. Given abortion restrictions in the wake of Dobbs v. Jackson and the fact that many autistic people are on Medicaid/are, which does not cover abortions, these adverse outcomes are becoming a bigger problem for our community. Police violence is an often-fatal threat to the physical health of Black autistic people and has been recognized as a public health issue. Police violence is never the victim's fault and no amount of police training can solve this systemic issue on its own. To reduce this threat to our community, we must decrease police encounters and hold officers accountable for the harm they cause.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many mental health conditions are inequitably diagnosed among autistic people. One study found that Medicaid-eligible Black children were 5.1 times more likely than white counterparts to be diagnosed with adjustment disorders before being diagnosed with autism. Labels of oppositional defiant disorder or aggressive, dangerous, & self-injurious behavior (SIB) disproportionately affect autistic people of color, especially Black autistic people. Misdiagnoses delay access to therapeutic support, leading to mental and physical harm. SIB is separate from suicidality. Studies from 2021& 2024 show disproportionate suicide attempts among autistic people. Suicidality is understood among those with lived experience as a "portal communicating to us what needs to change in society so that people want to live." Quality wrap-around services—not involuntary hospitalization—must be prioritized. The co-occurrence of gender dysphoria and autism is well-documented. Access to gender-affirming care is under threat, & it's of critical concern to the autistic community. ASD screening should never be required to access gender-affirming care at any age because it perpetuates the discriminatory myth that autistic people are "too disabled" to know ourselves. Avoidant/restrictive food intake disorder (ARFID) is common among autistic people, & leads to nutritional deficiencies. There is a lack of interprofessional education, training, & knowledge about treating ARFID in autistic people.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of support for communication creates significant challenges for people with learning, developmental, intellectual, and communication disabilities—not just the latter. All behavior is communication and behavior labeled as "challenging" is often an autistic person communicating or responding to an unmet need. ASAN has repeatedly emphasized a need for widely available, robust communication systems, including access to AAC devices. As noted by Communication FIRST, only "some of this technology" is available "some of the time, in some states, for some people who can somehow navigate their byzantine, and often biased, processes and requirements." We must do more to increase access to communication technology. The lack of widely

	<p>available plain language (PL) and Easy Read (ER) materials creates barriers for many autistic people with co-occurring disabilities. PL and ER materials give us more agency in decision-making, which has implications on guardianship determinations. As ASAN stated in our comments on HHS’ proposed Section 504 changes, “guardianship is predicated on a ruling that an individual cannot make their own decisions or communicate them effectively. Providing disabled patients with health care materials in plain language and Easy Read would make these decisions substantially more accessible to those with a range of cognitive, developmental, intellectual, or neurological disabilities and thus reduce some of the impetus for guardianship applications.”</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>Existing research, including reports from the Department of Defense’s TRICARE Autism Services Pilot, has pointed to the inefficacy of ABA: “43% [of ABA participants] demonstrated no improvement or increased intensity of symptoms over a two-year period”. Other criticisms cite impacts like “consent violations and removal of autonomy, pathologizing unremarkable behavior, and interventions where the risks are greater than the benefits.” However, we lack research that focuses on (a) additional harms of ABA to multiply marginalized autistic people, including those who are POC, Black and brown, nonspeaking, IDD, women, non-binary, trans, and LGBTQ+, from the Global South, people with mental health disabilities, people with co-occurring medical conditions, and people with higher support needs and (b) additional benefits of occupational, sensory, and other therapies to those same groups., Until research fully addresses the ways in which ABA specifically harms multiply-marginalized autistics, we cannot understand how to equitably formulate evidence-based ABA alternatives for these populations. In general, autism research needs to be led by and developed with autistic people and address the needs of autistic children and adults across the lifespan. Autistic people need to be involved in all stages of research design and paid for our work. Research about our community must be made accessible to us by communicating key findings in plain language and Easy Read.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>There is a dearth of accessible, affordable, & quality mental health (MH) care for autistic people with co-occurring MH conditions. Providers lack the education & training, as well as competence & confidence, to serve autistic people of all ages, with or without intellectual disabilities. This service gap prevents autistic people from receiving necessary support. Network inadequacy compounds the issue; “83.86% of all US counties lacked any diagnostic resources [for ASD].” Provider quality & quantity need expansion. Punitive seclusion, restraints (mechanical or chemical), & other coercive measures create barriers to MH care for autistic people. These cruel anachronisms are used disproportionately on autistic people of color, particularly Black autistic men & boys. More retrospective research is needed on the long-term impacts of restrictive & coercive practices, like the incidence of PTSD. Behaviorist interventions such as ABA should never be offered in lieu of or foreclose access to MH support. Behaviors termed “challenging or dangerous” are often natural responses to dehumanizing service systems or unsupported needs. These approaches prioritize outward conformity with neurotypical expectations over addressing underlying emotional distress. Effective modalities center patient agency. MH support includes, but isn’t limited to, individual or group psychotherapy, peer support, social or affinity groups, & other types of therapy (physical, speech/language, sensorimotor).</p>

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Long COVID is itself a co-occurring health condition. Autistic people have been found to have significant sequelae after infection. More research on autistic post-COVID experiences is needed, especially for Black and Hispanic people who “are more likely to report symptoms of ‘Long COVID’ than their White peers” though “White people are more likely to have a documented case of the illness”. Because of the heightened risk to our health, many disabled people have continued to take COVID precautions while many nondisabled people have stopped. Many autistic people are dismissed as “overly anxious” about COVID-19 when we insist on PPE and other precautions. In some cases, disabled people have delayed medical care because their providers refuse to wear PPE at appointments. We would like to see acknowledgment of PPE in medical settings as a reasonable accommodation under the ADA. As public awareness and reporting on COVID-19 has decreased throughout the pandemic, vital COVID-19 resources have disappeared. ASAN had to end its COVID-19 case tracker due to lack of data. Project N95, which donated vetted PPE to those in need, had to shut down due to decreased public support for masking and a resulting lack of donations. The loss of crucial resources as COVID continues to circulate and take lives needs to be addressed. COVID is an airborne virus, and proven methods of transmission reduction such as air quality monitoring, HEPA filters, and respirators should be broadly used.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The ongoing COVID-19 pandemic -as well as policies implemented to mitigate it- have had enormous impacts on autistic people for both good and ill. For example, the continuous coverage provisions authorized by the Families First Coronavirus Response Act enabled autistic people to maintain access to health care and services, and its expiration caused many autistic people to lose coverage. Provisions of the HCBS Settings Rule relating to community integration were delayed, which further heightened social isolation for those in congregate settings, while service disruptions put autistic people at further risk of institutionalization or reinstitutionalization. The provider shortage—while exacerbated by the pandemic—predates COVID-19 and must be addressed as a longstanding and systemic issue. In order for autistic people to receive higher quality care, direct support providers must be paid a livable wage, receive adequate training, & be free from workplace racism, sexism, & xenophobia. Increased use of and support for telehealth has expanded access to mental health providers and specialists, including for those who need specialist care that is not readily available locally. Efforts to preserve telehealth availability should ensure that they are and remain accessible for autistic individuals, particularly those with intellectual or communication disabilities.</p>

Name	Julie Bresette
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most challenging part of co-occurring disorders is that often traditional treatments such as medication and surgery don't work or don't work well enough.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge caused by co-occurring mental health issues is that only the symptoms are treated and any correlation due to autism is often overlooked and merely treated with an antidepressant.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenge is the way in which society feels these issues can be "trained" away. Meaning autistic individuals are required to conform.
What additional research is needed to help address co-occurring conditions for autistic people?	Additional research needs to be done on how autists respond to medication, the correlation between their nervous system and disease, treatments beyond antidepressants for anxiety and sleep, and how to better accommodate different learning and communication methods in everyday life.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Specifically, training the medical and mental health community as to how autistic bodies and brains function would be extremely helpful. Insurance coverage for autistic testing without stigma should also be made available. Access to and insurance coverage for physical and occupational therapy is needed as well.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive effects include more access and acceptance of remote meetings, acceptance of being germ-conscious, increased awareness of distance-learning opportunities, increased opportunities to work from home, and access to telehealth appointments. Negative effects include isolation, increased mental stress, and having to learn and navigate a new set of societal rules. An effect that has both positive and negative effects is the loss in masking skills.

Name	Julie Emig
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My child has autism. She experiences gastrointestinal disorders and sensory disorders.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My child is often anxious and can have a hard time focusing.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My child has difficulty connecting with peers.
What additional research is needed to help address co-occurring conditions for autistic people?	Any and all methodologically sound research is needed and applicable! The more we know about these conditions, the more we can be proactive in treatment.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage. Holistic approach from all clinicians.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Nothing in our family related to autistic child...just the standard need to adjust to the consequences of isolation from Covid. Plus my spouse suffers from long Covid. The ramifications of long Covid for families in general are desperately in need of study to garner education and support.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	For my family the most significant ramification has been the diagnosis of long Covid for my spouse. This affects the entire family and inhibits professional/work—not to mention lack of energy as a parent.

Name	Julie Lackey, OKIPSE Alliance
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	<p>Sleep Disturbances: Lack of quality sleep not only impacts the person diagnosed with autism but also the parent/family. Brain function, including emotional regulation, impulse control, ability to make decisions etc. are all negatively impacted by lack of sleep, including sleep with nightmares, which are often the side effect of medications. Example: when it is time to make a medication adjustment, if the person with autism is sleep deprived, you cannot tell whether it is a problem with the medication, or just because the person is sleep deprived, which then can cause an incorrect decision to discontinue a medication. In addition, when an individual is awake at night, that person is not necessarily safe, so that situation then impacts the family member who must also be awake. This in turn impacts the family member's ability to function. Innovative methods of treating sleep disturbances - could brain ultrasound be utilized as it has been for addiction for instance?</p> <p>Sensory Challenges: There is not enough research and new ways to work with individuals that have autism with sensory issues. Innovative new treatments are needed that are NOT medication based. Sensory challenges can impact literally every moment of a person with autism's life. Think about it, if your hearing, smelling, feeling, seeing, tasting and touching are all either on hyperdrive and ultra sensitive or muted which can set a person up for a dangerous situation, life gets very scary.</p>
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Innovative methods to treat both anxiety and ADHD that are not medication based are needed. For instance can ultra sound be utilized in the brain as it has for addiction? Co-occurring mental health conditions: Anxiety: anxiety affects everything in a life. If a person is anxious, they simply cannot engage in therapy, or any activity without being hobbled by fear. ADHD: In our son's 26 years, we have seen a definite loss of interest in the medical community to coming up with either more targeted medications or non medication based therapy. Particularly for young adults, there is practically nothing that is truly new and innovative to try to help these individuals. ADHD can make employment, social, sleep and interactions of every kind difficult or impossible to be successful. Think about it, the inability to modulate impulse control and stay on task is a recipe for failure in every area of life.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	<p>Intellectual disabilities - there are not enough therapy techniques that deal with the fact the intellectual disabilities often co-occur with autism, particularly with mild ID. There is more emphasis on severe ID, however mild ID with autism can hinder a young adult's potential success with employment as they tend to fall in the cracks between not quite "typical", but not impaired enough to be good candidates for the low level jobs typically ascribed to the ID population. These young adults can succeed if they had informed, educated support personnel and educated employers to provide minimal supports that can help them be successful and engaged citizens.</p> <p>Communication Disabilities- repeat of the above verbiage. Simply insert "Communcation Disability" in place of ID. With this addition: When a person with autism cannon communicate, which can happen even with a high functioning person under duress, that is a dangerous situation waiting to happen. Our first responders need more training to prevent negative outcomes with interacting with these neurodiverse individuals.</p>
What additional research is needed to help address co-occurring conditions for autistic people?	Studies beyond ages 0-14 that deal with everything I have referenced . Although there is not enough research for all ages, there is definitely much more research put towards young children. It is almost like the medical

	<p>community decides that once a person reaches high school graduation, they no longer have autism. In reality, young adults desperately need research on all the conditions I have listed in this survey. Once they no longer have the support of the K-12 system, they are often "on their own" as agencies are not equipped, understaffed, and working with old information that treats them like they are all the same and often do not assume competence with does these individuals a grave disservice. With the numbers as staggering as they are for autism diagnosis, it should be incredibly obvious that targeted research is desperately needed for these individuals. We have a young adult son, I used to run a parent group, have started social skills groups in multiple schools, have a non profit that funded 2 inclusive post secondary education programs, and now am the Director of a state Alliance that is all about inclusive post secondary education. I have direct experience and know what I am referring to in this survey.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Focused personnel that are trained to work with young adults rather than children. Studies that focus on young adults (ages18-26). The Inclusive Post Secondary Education initiative across the nation now lists over 300 programs in 49 states. Combining research with these IPSE programs to work on specific ways of supporting this population would be a natural fit for new frontiers to help young adults. See Think College.net for more information.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The lasting negative impacts of increased remote work and school...rolls down to IPSE programs for young adults. The move to remote classes after COVID puts individuals with autism in a format that goes against their need to learn social behaviors as adults. Reducing everything that goes into being a successful member of society - including good hygiene practices, communication practice, interpersonal relationship practice, and beyond.</p>

Name	Julie Schweitzer, UC Davis
Demographic	Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Our research findings demonstrate a very high rate of symptoms associated with ADHD in autistic youth. This includes increased inattentiveness, impulsivity, challenges with emotional regulation, irritability, planning, organization and so forth. Similar to what we observe in ADHD, these symptoms, cause challenges in academic and occupational responsibilities and in their social relationships. Because we know that impulsivity in ADHD can lead to higher suicidality in ADHD it is worth exploring if this is also the case in autism. As autistic youth mature, their parents increasingly request assistance for these issues, particularly once they feel that language and other social challenges have been addressed. We have much to learn about how ADHD symptoms in autism differ from how they present in ADHD without autism. We do know that there is insufficient interventions to address these issues in autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Independence, physical health issues and others.
What additional research is needed to help address co-occurring conditions for autistic people?	Research into the causes, be they environmental, genetic, epigenetic. Novel treatments as many of the treatments seem to be variants based on some of the same ones used for decades.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insuring that the services are of high quality. Equitable access and services available through the entire life span. Making it easier for families to understand how to access services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I cannot give a fully informed response to this question.

Name	K
Demographic	Autistic individual; Researcher
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>GI disorders, sleep disorders, and sensorimotor challenges affect almost all autistic people. GI disorders can be particularly frustrating because they stack on top of existing difficulties with food and eating. Similarly, sleep disturbances can worsen mental health, reduce tolerance for sensory stimuli and changes, and increase the risk of other physical health problems. Many of us also have issues with joints that are less often talked about. Headaches, including migraine, are also more common and can be triggered by or increase sensory overstimulation, and they might be under-recognized because of their seeming similarity to sensory overstimulation. Dysautonomia may also be under-recognized and can be very disruptive when present. Epilepsy is less common among high functioning autistic adults but very common among those with ID and is a potentially very serious issue when it is present. Finally, stress, poor eating, poor sleeping, and poor self-care can increase the risk of type 2 diabetes, autoimmune diseases, heart problems, or similar conditions.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Depression and anxiety are extremely common mental health concerns for autistic people, especially autistic women. Another major concern is OCD, which can overlap significantly with autistic rigidity to the extent that it can be difficult to differentiate. OCD can interact with autism to cause severe daily life difficulties, such as worsened need for routine, difficulty with adaptive functioning, restricted eating, and social isolation. Finally, posttraumatic stress and dissociation are under-recognized despite autistic people experiencing trauma and specifically interpersonal violence at extremely high rates. Trauma can not only significantly impact mental health, including increasing self-harm and aggression, it can also contribute to social isolation, reliance on predictable routines, cognitive rigidity, and loss of skills. However, there are very few mental health providers who are willing to treat posttraumatic stress in autistic individuals, especially those who have higher support needs.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>A high proportion of autistic people have ADHD, and even those who aren't hyperactive, inattentive, or impulsive still struggle with executive dysfunction in the form of difficulty initiating, transitioning between, or stopping tasks. This can make autism much more challenging. ADHD can often lead to an overall more severe presentation, and executive dysfunction without ADHD is often offered no support. Similarly, "spiky profiles" often lead to overlooked strengths or unmet needs, including specific learning difficulties or processing weaknesses being ignored. Finally, individuals with co-occurring intellectual disability or language impairment are among the most vulnerable autistics, yet they're often overlooked because many of the most severely impaired individuals are unable to participate in self-advocacy, are difficult to research, and require high levels of support that many are not willing to acknowledge.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>More research is needed on autism and mental health, particularly PTSD and OCD. Additionally, more research is needed on managing and treating co-occurring disorders, especially GI and sleep disorders, as well as preventing chronic illness as autistic individuals age. Too many studies only include children, only examine prevalence, or are only concerned with potential causal mechanisms for autism. The focus needs to shift to how to improve quality of life throughout the lifespan. This includes improved assessment, medical and mental health professional interactions with autistic people, self-care and condition management, and long-term outcomes.</p>

<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>It's difficult for many autistic people to access services. Many autistic people do not work fulltime and cannot afford quality care. Inability to drive or use public transportation can also make accessing doctors difficult. Professionals, especially mental health professionals, may not work with autistic clients. Doctors may not be thorough in investigating potential problems in particular for autistic clients who have very unusual speech, no speech, or intellectual disability. Diagnostic overshadowing is a major risk, especially for autistic individuals with higher support needs. Doctors may be belittling to clients or ignore them in favor of only communicating with caretakers, leading to very negative perceptions of or fears of medical environments. Finally, autistic individuals may not have the support needed to appropriately take prescribed medication, struggle to change their diet as recommended, or otherwise be unable to follow treatment recommendations on their own. Increased access to services, professional training, and home-support or creative solutions to improve self-care are needed across the board.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>COVID-19 infection and illness worsened co-occurring conditions for many autistic people. Pre-existing fatigue, GI dysfunction, and dysautonomia could all be worsened, or they could newly develop or reach clinical levels. Additionally, the stress of the pandemic and quarantining worsened depression, anxiety, and OCD for many. Loved ones becoming ill could also severely negatively impact mental health, especially if the loved one died of COVID or a related complication.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The impacts of COVID on society were mixed. Increased remote work and school could increase social isolation and negatively impact social skills, but they were also less cognitively demanding for many autistic individuals. Remote participation involves less sensory overstimulation, less need to cope with changes and transitions, and no need to worry about driving or managing public transportation. Similarly, increased telehealth expanded healthcare access. Many autistic people also find it easier to communicate through mediums such as emails than in-person conversations. Fewer in-person social demands also allows autistic people to interact on their own timeline and avoid overwhelming environments. More online social events could increase community inclusion and socialization. However, those who cannot reliably access or use the internet well may be more severely negatively impacted. Finally, disruptions in services are always a major problem.</p>

Name	K
Demographic	Autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>I find that I don't know everything about health related conditions to autism. There isn't enough available information for me to access, and when I've asked for medical advice I've been shoved to the side. I do deal with gastrointestinal problems, questionable sleep patterns, and as of lately, sensory issues are a huge problem for me. Some days I wake up with my senses in hyperdrive, and smelling anything is enough to make me throw up—even if I like the thing the smell is associated with. (Fried fish and lemon, espresso, coffee vanilla extract, etc) other times I have to wear sound-cancelling headphones because the sound of someone's breathing, another person's chewing, someone's laugh, the radio over the loudspeakers—is too much—and makes me want to tear my hair out. I also have audio processing troubles—if someone doesn't enunciate their words clearly or let me watch the way their mouth moves when they speak, I can't articulate a single thing they said. It's even harder when I'm trying to talk to people with stronger accents, and it's not their fault, but I feel absolutely terrible that I can't understand what they are saying.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>For me, depression and anxiety is a big one. I'm also trying to get an adhd diagnosis, but it's difficult because the medical field doesn't take me, a female passing person as seriously as they do a male. I can't get a diagnosis for something I clearly have, because it's just severe anxiety, and I'm shoved off. My anxiety makes it difficult to speak up about things that bother me, in relationships and in groups. This leads to severe miscommunication and extremely hurt feelings on both sides. I also have a severe case of abandonment issues—combined with the anxiety it's not great. I am constantly hyper-examining people and figuring out the best personality they would want around them, and I perform exactly how they would want me to. I've done this for so many years, I don't even know if I have a personality. I'm whatever anyone wants me to be. My depression makes it difficult to do literally anything. I'm grateful I'm on medication, it's easier, but it doesn't cover every problem. I'm constantly searching for my next source of dopamine, what will make me want to do something—and I'm incredibly grateful that those sources are found through media, and not abusable substances. I frequently worry I will become an addict in the future because of how strong my need for dopamine is.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	<p>When I was a kid, I didn't know how to act. What was a normal thing to say. But I loved reading, I was hyperlexic. So I would become characters I read about or saw on tv—because it was the only representation I got as to behave. it got to the point where I had to sit outside of the classroom in kindergarten while I waiting for the class to finish reading Junior-B-Jones. And it was the reason I wasn't allowed to watch SpongeBob as a kid. I never had explicit issues in school. I was an overachieving kid, but when I got to highschool, no one cared about it, and I had no resource for when classes got harder. I didn't develop study habits, I got increasingly frustrated with everything. If something didn't immediately spark my interest—I didn't care about it. It was hard to pretend to be interested in conversations I could care less about.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>More representation in female studies. Most autism diagnosis go to people who have been socialized as men, however a majority of people socialized as women are also autistic, they have been taught their whole lives how to mask it better, and find it difficult to get valid support from medical professionals. I find myself dismissed and humiliated when I try for</p>

	<p>diagnosis, it's stressful, and discouraging. Sometimes even finding a female practitioner won't take you seriously. I got told I was too anxious and depressed for them to tell, and that I might be autistic, I might not—which isn't a solid answer. I can't get accommodations for that. How is it that everyone I knew as a kid could tell there was something different about me, something they couldn't describe that made it difficult to form relationships, but my own parents and people with doctorate degrees couldn't. TLDR: do more studies on women/afab people with autism.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>All of that. It's hard for me to make appointments and keep them, it's hard to phrase things to a doctor in a way that will make them see what I am saying and not what they think they are hearing. They often have selective hearing about patient issues, and I'm taken less seriously because of my anxiety, depression, and woman-passing appearance.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I've loved the increased availability of remote work. It doesn't always work for me, I need to be in a physically different place I associate with getting work done, and my home doesn't really have that mindset. However I love that it is an option. Some days when I can't make myself get out of bed, it's easier to convince myself to do my work remotely then getting up and doing my get ready tasks. However, I found that the inability to rely on services, due to unresolved understaffing from poor management during COVID, is increasingly frustrating. That needs to be addressed immediately. Covid allowed a lot of people already in power to take advantage of it. And it's not okay.</p>

Name	K
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Maintaining a healthy diet while having GERD, food aversion, anxiety and ADHD as well as autism impacting ability to grocery shop. Hard to get consistent sleep due to sleep apnea and insomnia. Difficulty with fine motor skills, balance, coordination due to dyspraxia
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Social distress due to RSD as a result of social rejection and harassment due to autism. Lead to self harm, panic attacks and isolating.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Mostly executive dysfunction. I'm personally hyperlexic so I'm able to take in and understand information easily but starting and organizing tasks is a struggle
What additional research is needed to help address co-occurring conditions for autistic people?	I think there needs to be an understanding of the vast developmental differences in autistic people. Some people are non verbal, some are dyslexic and others hyperlexic. Some people suffer from dyspraxia while others suffer no coordination issues. It seems that autism is so vast that its really hard to encompass everything that can come with the label.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I think it shouldn't cost so much money to access an autism diagnosis. I think the opportunity to work with individuals to help them determine what career direction would suit their skill set and giving them the tools and resources to develop those skills such as working with trade schools or colleges or on the job training.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think it sucks that remote work was only offered temporarily despite the fact productivity didn't decrease while people worked from home and allowed them to save time and money commuting. Telehealth is still available but now certain medications are not allowed to be prescribed via telehealth. These services were temporary and taken away so people could go back to micromanaging every aspect of our lives even though it doesn't improve productivity or morale or save money. I think things were better when we all had to wear masks and stay six feet apart and the rules were all black and white. Now it's mask if you want to and try to stay away if you have flu like symptoms but there are no actual rules.

Name	K
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I would say my biggest co-occurring conditions would be daily gastrointestinal issues including IBS as well as the overall joint and muscle pain. My closest comparison is HEDS right now but its immensely tight muscles that get pulled or strained due to weak joint that cant hold up. My hip has popped in and out since i was a teenager (~15) and i would say I pull a muscle weekly.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	On the mental health side my ADHD has had quite an impact on my life. I was diagnosed late in life which i heavily regard to my autism internalizing a lot of my symptoms making it less noticeable. This caused a battle with separating what is causing different symptoms which were commonly blown off as anxiety. I noticed my depressive symptoms only increased when overstimulation but were labeled as depression rather than a symptom of the stimulation
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My main challenges showed up in dyslexia and a disinterest in reading for most of my early education. This led to me being put in additional reading help. I also had a lisp and was in speech therapy for many years
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Coverage for every day consumables like KT tape, heating pads, earplugs as well support in work settings where accommodations may not be supported initially
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kaalyn
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Pain conditions, light sensitivity, auditory processing disorders, visual disturbances, and temperature dysregulation make outings, doctor's appointments, socialization, and general independence a near impossibility. The overstimulation maxes me out before I can even leave my home. The need for captions, low light, quiet places of reprieve, and operational hours later in the evening (the darker hours) are just non-existent in aggregate. I'm additionally a wheelchair user and that alone is a barrier to society independent of the autism.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Complex childhood trauma and autism go hand in hand like PB&J. The mistreatment by caretakers, schoolteachers and admin, doctors, psychologists, and larger society is everywhere. We are easy to abuse bc people assume we don't understand what's being done to us. That no one will find out. That no one will care anyway. That we deserve it. So much gaslighting, trickery, abuse of power, berating, physical violence, punishment for existing, and so much more. We are also extremely vulnerable prey to sexualization and predation. The overlap in symptomology between complex trauma and autism also makes many of us go misdiagnosed for decades (from either condition). Lack of education and awareness is terrible. ADHD and Autism also have competing symptoms constantly, but frequently pair together.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Auditory processing issues, dyslexia, dysgraphia, and speech conditions create an even greater barrier between us and the world we're trying to interact with. People assume we're dumb, slow, childlike, or require our parents to speak for us. Many of us are actually the most intelligent person in the room but can't get a word in edge-wise. But if we mask well and perform social norms beautifully people automatically flip the script and say we're lying. Self-diagnosing. "High functioning". Or other invalidating sentiments. We're caught in a double bind just to be heard. Let alone respected and valued.
What additional research is needed to help address co-occurring conditions for autistic people?	Research into the overlap between autism and (separately): - Complex PTSD and dissociative trauma disorders - queer and gender non-conforming identities - Ehlers-Danlos Syndromes - POTS - MCAS - perseverance on social injustice - delayed dx of female-presenting children - disparity of delayed dx in non-white populations - A re-examination of the spectrum gradient and the benefits/cons of functioning label use
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	- less focus and public education on things like vaccines, cures, and prevention - increased science communication to the public on the diversity of "what autism looks like" - WILDLY more accessible testing/screening for dx (i.e. cost, number and availability of physicians, insurance coverage, etc) - increased *accessible* transportation to appts (i.e. noise and stimuli controlled, RELIABLE pick-ups/drop-offs, services that extend to rural areas - ease of application process to receive social security benefits - more insurance and medicaid/-care approved tools and assistive tech (headphones, communication devices, motor skill and orthotic supports, etc)
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Vaccine hesitancy revived a reducing fear of autism being caused by them. Isolation massively hiked up the loneliness and ostracization of us from society Progress being made socially has regressed dramatically in 4yrs Masks make lip reading and auditory cues and more blurry/non-existent
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	Truncated this answer with the response to the last one

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Kacey M
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Ehlers Danlos Syndrome (hypermobile type), Postural Orthostatic Tachycardia Syndrome, Mast Cell Activation Syndrome, Gastrointestinal processing disorders, auditory processing delays, chronic fatigue, sleep disturbances, heightened nervous system reactions, dopamine driven addictions
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, C-PTSD, OCD, ADHD, unhealthy attachment issues for human connection, ARFID, eating disorders, suicidal thoughts, alexithymia, panic disorders, dissociation from stress, derealisation, insatiable urges, extreme impulsivity
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Sensory overload, dyspraxia, chiari malformation, apraxia
What additional research is needed to help address co-occurring conditions for autistic people?	Whether or not ASD has any different types of classifications regarding where peers might have common traits with bodily structures (beyond support needs). What type of environment is well suited for a student with low to moderate support needs, moderate to high support needs, etc.. commonality between types of passion topics. ways for medical, educational, and supportive professional to develop tools for autistic people. Learning why ABA therapy has been used, and how to learn tools to succeed without sacrificing our own wellbeing. Data collecting for which doctors know what undiagnosed autism can look like, and how to support the patient. Why hEDS is common, why dysautonomia is related, what happens during a nervous system “breakdown”, how ASD bodies react to different conditions (temperature, textures, overall senses and nervous system responses), histamine intolerance commonality rate, allergy rates, location and environmental factors during/post puberty
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to more support, more funding towards social services, including mental health and wellness services into the medical system and not a separate and exclusive services, public education training AND funding, systemic accountability for the failures of how marginalized people are treated, higher research rates in people who are not just white, male, young autistic people, updating the DSM and medical terminology for people who are autistic, reformation of testing for ASD to exclude biases of racism, sexism, ablism, non-abrahamic religious based discrimination
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I am often unable to breathe through my nose, constant nasal congestion, food processing issues has become more frequent, social isolation, chronic fatigue, constant anxiety for health
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	Remote services /telehealth was a positive change. Destabilizing responsibilities and accountability (financial, educational), inflation of medical and professional costs, increase in unsafe behaviors (dopamine

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	seeking), stress in overall state of economic collapse and societal instability due to COVID was a huge negative impact for the autistic community.
--	---

Name	Kaela
Demographic	Autistic individual
<p>What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)</p>	<p>I'm extremely impacted by exhaustion, gastrointestinal distress, anxiety, migraines, and joint pain. I find it very hard to eat nutritionally consistently, not only because of sensory preferences, but also because I am often nauseous for no reason that doctors can figure out. I struggle to ever feel rested no matter how many hours of sleep I get. My anxiety has a negative impact on most areas of my life. My biggest source of pain is from migraines, and it has been a multi year journey to get any sort of reliable and effective treatment for those migraines. Part of it was discovered to be due to joint issues, but most of my bodily issues I learn about connections from people within the autism community and doctors never seem to know that information or how to help.</p>
<p>What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)</p>	<p>Sorry I grouped anxiety in with the last question. Yes, I have severe anxiety and have found mild relief from an SSRI but it's still tough and the fact that my brain works differently always seems to be the problem and not just a symptom of the problem so many people invalidate it or just treat it as a normal and expected part of the autistic experience.</p>
<p>What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?</p>	
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>PLEASE fund research done BY autistic researchers as all other research has so much inherent ableism and neurotypical bias it is so dismissive of the autistic experience and therefore does nothing to actually help others learn about and support the autistic experience in an authentic way.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>That would require such an overhaul. Increased testing for people who lack access to be able to get testing covered by insurance. Shorter wait times to diagnosis. More clinicians trained in late diagnosis and autism in women which is STILL missed so often. Training done BY autistic people not by neurotypicals who view us as incapable children. Insurance cover for therapy for autistic individuals. Insurance coverage for nutritionists for autistic individuals. I think being autistic should automatically qualify people for Medicaid as so many of us are multiply disabled and can't access the supports we need.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced</p>	

in-person social interactions and obligations)	
--	--

Name	Kai
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disorders. Every symptom of my autism is exasperated by my lack of sleep but I have struggled my whole life to sleep more than 4 hours a night except rare days when I sleep 12 hours or more. I've been put on sleeping pills before but their effectiveness diminishes rapidly if they work at all. So much would be easier if I could just sleep
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Adhd. The symptoms overlap and conflict in the most annoying ways. I need routine but routine is nearly impossible for me which causes a ton of my anxiety and depression. I think I'd still have those if I was only autistic but being both autistic and adhd makes it worse I think.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Anxiety combined with my lack of understanding of general social stuff is absolutely terrifying and I'm often nearly paralyzed by anxiety in social situations to the point my stims turn self harming without me noticing. Me fingernail beds are often torn and bleeding from it.
What additional research is needed to help address co-occurring conditions for autistic people?	Sleep studies, more research on how many medications interact differently in our brains to find more effective ones, educational program development aimed at teaching autistic people to better read and understand social situations rather than just how to mimic them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More general medical professionals knowing how to communicate with autistic people. I get so anxious going to the doctor and I don't know what I'm doing and they tend to rush appointments and then I don't end up receiving care unless I bring an advocate with me. Maybe making it easier to get a trained advocate
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Useful! Much less in person interaction required. I can order groceries online, I can wear a physical mask more so I don't have to think about my facial expressions so much. People respect personal space more

Name	Kai C.
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Personally I have a combination of autism and ADHD. The worst physical symptoms I deal with are in relation to things like my dysautonomia. I have a hard time sleeping and getting comfortable in bed. My heart rate is irrationally high at different times even when mentally I'm relaxed. I have frequent body aches and pains and I'm not sure if it's because of my dysautonomia or of some other medical condition like being so desensitized to pain at this point that I don't usually register it when I hurt myself.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Personally I have a combination of autism and ADHD. My depression was the absolute worst of my symptoms pre-medication. I really desperately used to eat my feelings as my coping mechanism and the only daily comfort I really had. Eating your feelings when you don't understand them and have no impulse control is often a central issue of people who develop eating disorders. Now my worst symptom mentally is my anxiety. I have horrible social anxiety as well trauma from decades of being bullied that I'm constantly dealing with, and the willingness to get out of bed sometimes is the biggest challenge of my day, because facing the world means another exhausting day of anxiety even with medications. When I am irritated or overstimulated I get very aggressive and often don't recognize why until I am out of the situation, and typically it makes me have intrusive thoughts of either harming others or myself that I need to get away from. At times I go into full manic episodes where I feel the impulse to drive on the interstate at 90mph. Others I fully lose all focus on everything except my anxiety and sensory issues and want to dig myself into a hole and just stay there. The anxiety medication helps a lot with this irritability as they limit external input to some degree and make it less overwhelming. I have struggled with suicidal thoughts because of all of the aforementioned things.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication is number 1 for me the absolute worst to deal with. Trying to convince neurotypical people that you literally say what you mean without ulterior motives or implied meaning is the most annoying and irritating thing in the world. Learning disabilities are usually at fault of the teacher in my experience if I get someone who can explain something or answer my questions in detail when they come up I don't have a problem. Personally the worst issues I have with this are with religious people who would rather preach at you than actually answer a reasonable question about the very thing they are attempting to teach you, as if I as someone who doesn't experience the world in the same way am to just accept everything they say as fact when they cannot back it up. This led to a lot of abuse as a child, and leads to a lot of assumptions on the part of others and miscommunication as an adult. If you give me the correct words to explain a feeling or you can draw me a picture I can better understand, but I don't understand irrational "emotions" when you only describe them as "I don't know, you just feel it." We need more education about neurodiversity in general in religious organizations.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on how schools teach media literacy and doing it early. It is one of the largest things I have overcome in learning "Oh when people say this thing, they actually mean-" and outside of a realm of the scientific, even things like metaphor and hyperbole can often fall flat. Now, I am very good at understanding the nuances of things. As a child, I thought cartoons were real and I could chase someone with a hammer or a knife and them still be okay afterwards. You need to explicitly layout that there are more than just good

	<p>and evil in the world, and as such much like neurodivergence, good and evil exists on a spectrum. Black and white morals and a lack of nuance in early understanding of ethics creates a dichotomy where autistic people who take things very literally will only trust science and their own experiences until the point that they are proven wrong, and then are put in positions of direct opposition to those of faith at an early age because we seek clear and concise answers even though nothing is clear in actuality.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Understanding patients’ sensory needs in environments like doctor’s offices, hospitals, etc. and allowing them to carry sensory devices with them like headphones, fidget toys, etc. I don’t think I’ve ever walked into a hospital where I have actually felt safe in the cold sterile environment with the loud beeps and boops of the machines. We also NEED to allow for diversity in how doctors view autistic patients. We are not all [redacted] or savants, we are a larger more diverse group of people and deserve not to be treated like children and buffoons, or treated like we’re “too smart” or “too self aware” for mental healthcare when we may just have the language for what our issues are and not how to deal with them. Listen to people when they bring up problems, and trust that they’re smart enough to know what’s going on with their own bodies. I have been attempting to get treated for POTS for 10+ months now and none of the doctors believed my speculations aside from my general practitioner, and yet they put me through so many unnecessary expensive cardiological exams seemingly because they didn’t think my own interpretation and research of the symptoms was enough to go off of. Had they listened in the first place like my general practitioner did I could have saved somewhere in the range of \$750 of unnecessary medical bills.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>It’s scary because we are now seen and treated as second class citizens because we’re considered disabled. I don’t want to be the last person in the hospital to be seen because I have so many comorbidities someone thinks I’m better off dead. Frankly it’s awful how disabled people on the whole are treated in this country and how we’re frequently the least of anyone’s considerations.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Increased remote work. Decreased incentive to socialize in situations where I’m uncomfortable. Less talking to strangers. Increased boundaries in my general life being respected by more people as to where they were barely respected previously. Now I don’t have to worry about strangers in the super market putting their hands on me. I don’t have to worry about people walking up to me and harassing me for “looking weird” or “looking tired” as much.</p>

Name	Kaisi rolfe
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression anxiety adhd pda
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication and social skills
What additional research is needed to help address co-occurring conditions for autistic people?	Any research in to neuro diversity is needed
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Patient provider interactions. I believe all schools should be teaching the Ron Davis method for both neurodiverse and neurotypical. Far to many children/adults are growing , maturing with essential life concepts being missed
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Karen
Demographic	Family member of an autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	For us the most significant challenges were and still continue to be behavioral challenges and the level of functioning due to intellectual disability. The lack of awareness of self and of danger significantly impacts my son.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The mental health conditions my son experiences are ADHD and depression, severe anxiety that is debilitating ..causes him to be unable to leave home. He has not been anywhere except a doctors office in many years.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The biggest challenge with intellectual disability relates to the level of functioning in all areas. Speech deficits significantly impacted his communication and developmental disability as well as intellectual disability affected quality of life and the entire familys quality of life
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	We did not have COVID-19 to my knowledge
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Karen Ashikeh, Registered Nurse- Health Adviser
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Dental care is an ongoing and lifelong need that is not well served in the training of dental care staff, including dentists and is very hard to find in many communities. Often many miles away for dentist experienced in the needs and ways to provide basic care for this population, as children. Working with several other children in the room is problematic for these children but is often part of routine Pediatric dentistry. The need for sedation during some routine and many complex procedures is also a problem getting permission from insurance. Dentists with experience working with autistic children do not let their patient families know when they move to another practice. This should be done for consistent care and for best standards of care practices so families can find alternatives for emergencies and routine care.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Problem: Not using the training children get to express these conditions of concern, pain or fear, with clear and understandable communication leads to these other behaviors. Using, routine mental health check-ins, with devices available, is one way to encourage understanding, acknowledgement and empathy from care givers that may help reduce other, more unwelcome behaviors. The ways to express, sadness, pain, fear and concerns about self and others need to be incorporated into materials like tablets and electronics, pictures showing concerns that children can point to and should be used at the start of any major daily activity period, wake up time, school lessons, returning home, etc. can be starting points. "How do you feel this morning?" " Are you feeling well today?" Are you glad today? Sad today? Training for ways to reassure and assist when responses are not well or positive or secure, may be some of the most important "lesson plans" between parent/child and child/teacher or other adult or other child. The need for other ways of expression may be both less effective and more problematic for all. Focus on clear feeling and status of wellness communication sooner and more often to help all ask and know how the other is doing.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Inability to speak what is known, perceived and felt, observed and understood is a disadvantage to many children and their families. Everyone is happy when forms of communication are identified for needs, feelings and thoughts, even if the result is not what is popular or good news. Dealing with the news one has a hard time hearing is difficult part and more help and support for parents, families and other relatives is needed for the best outcomes. Support groups, on line, to allow parents and others to share information on techniques and problem solving, would be helpful during times children with these problems do not attend. Perhaps late evening?
What additional research is needed to help address co-occurring conditions for autistic people?	1.Support groups for parents and family- when should they occur. 2.Dental care training and Pediatrician training and webinars or CE credits for dentists and pediatricians and staff that care for these children. 3. Review of electronic learning systems to recommend ways for users to express feelings - happiness, sadness, anxiety, fear, worry about self or others, aloneness and feeling there are too many people to cope with. Also identifier of name and address, phone # Ideally, Small, hand-held devices or necklace-type units should accompany the child where they go so they can communicate clearly with those around them, at any time. A good device to point to when encountering police, if ever stopped. Police need to be trained to recognize

	such devices as identifiers for those with autism or speech or other disorders and how to use them to interact with that person to assist them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Training and use of assistive devices to communicate by police, teachers and others to identify feelings and concerns could provide a standard and consistent ways for all who interact with the person, as well as to identify demographics and a listing of any co-conditions the person has and what help needed and who should be contacted in emergencies. These can be used by family, teachers and health providers or in community interactions and should be a standard part of the earliest interactions that a child is taught from early childhood. The regularity, use and consistent methods of such interactions is both reassuring and routine for child and for helpful to those interacting with them. It should bring reassurance, communication tool and increase understanding that allows best outcomes of whatever the situation or issue.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Options for home-schooling greatly improved. This individual learning could be augmented but group activities for small groups of home-schooled children with autism, in person play groups or discussion and activity groups for older students.

Name	Karen Barrett, Barrett Consulting
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Invisible disabilities such as a delay in executive functioning, and pathological demand avoidance predisposes the individual to the misguidance of well-meaning institutions, such as the education and judicial systems. As per atpeaceparents.com 'Pathological Demand Avoidance (PDA) profile is often missed by professionals or misdiagnosed. There are two reasons for this: It is not yet a category for diagnosis in Diagnostic Statistical Manual (DSM-5) and because PDA produces paradoxical behavior that challenges the conventional wisdom on what is defined as "Autistic" (e.g. These children can often make great eye contact, have strong verbal skills, and a strong interest in social engagement).' My son has several comorbid conditions enabling all of his functionality which includes being able to ace material on tests however is unable to fully implement the skills necessary to master material. This type of disability masks the true achievement level of the individual being evaluated and the evaluation criteria of eligibility requirements to continue to be able to receive a free and appropriate education are skewed, even bias, masking real results. We need to changes these violations of human rights asap, thanks.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Acceptance in social situations
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Existing misalignment of teaching skills impede human progress
What additional research is needed to help address co-occurring conditions for autistic people?	Empirical testing as per atpeaceparents.com and other organizations that continue to log results such as behaviorinterventionsinc
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Education to all administration managements and other employees and staff that directly or indirectly impact individuals with and IEP
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	regression
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal	regression

changes: disruptions in services,
increased remote work and school,
increased use of telehealth, reduced
in-person social interactions and
obligations)

Name	Karen Gee
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gut health, sensory issues,
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression. Anxiety. Loneliness.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Unable to have friends. Doesn't fit in with peers. Socially awkward. But wants to have friends.
What additional research is needed to help address co-occurring conditions for autistic people?	Identify why an increase in autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Government needs to give tax credits to Businesses that hire autistic individuals. My grandson is looking for work where he can excel. All he needs is additional training on the job and he will always show up
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Could make them more nervous to go out In Public
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Affected their group sessions which is sometimes the only in person contact they had.

Name	Karen Kaye, Executive Director, Foundation for Autism Support and Training (FAST)
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	autism with psychosis and OCD
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The lack of ability to hospitalize someone with autism and psychosis in Maryland. Only 7 beds available and you can't get in unless your in an emergency room, and if they 'Happen to have an opening then" otherwise your only choice is to throw them into the emergency room for 2 to 3 months and wait for an opening, which is a non-starter. So I had to treat him at home on an outpatient basis and I have endured much physical abuse in the process, trying to stabilize him. He is 30.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Medications either don't work or they present onerous side effects that are so dominant, it is not worth any good they might do. How can anyone tolerate your childs head snapping forward constantly, ridgid posing, constant grimacing. The meds are just horrible.
What additional research is needed to help address co-occurring conditions for autistic people?	Much research is needed on medications without side effects. Risperdal and Abilify are non-starters in my opinion, but everyone insists on starting trials with these for autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Ability to have hospitalization for stabilization for autism/psychosis. He was on Thioridazine for 15 years and I never knew that when we had to wean him off, he would go into a psychosis and regress so extremely. Families need to better understand the risks of those heavy neuroleptics with autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It allows more remote services and that is a good thing
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	interruption of services, lack of socialization, tremendous regression being home 2.5 years.

Name	Karen P, Special Educator/Autism Consultant/BCBA
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The medical community acknowledging co-occurring conditions is a problem. Too often they just say "it's autism" and don't dig deeper. If the underlying health conditions were addressed, the "autism" often is easier to address. You must take care of basic needs FIRST before education/learning can occur, and those basic needs include dealing with underlying medical issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I work primarily with young children. I see most anxiety and ADHD issues in this population. In my limited experience with older children, I have seen anxiety have a tremendous impact, as well as depression.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenge in this area is communication. Regardless of developmental disabilities, intellectual disabilities, etc., if an individual is not able to communicate effectively it will impact all other areas, including behavior, learning and mental health.
What additional research is needed to help address co-occurring conditions for autistic people?	How to accurately identify and treat co-occurring conditions
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	"buy in" throughout the medical community a tremendous lack of availability and long wait lists for any mental health treatment
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth services for this population are minimally effective, as a whole. Since COVID, with staffing shortages, sometimes telehealth is the only thing being offered. This is not effective or adequate for many of the individuals on the spectrum. The overall lack of staffing and long wait lists were bad before COVID but are significantly worse since COVID, with no end or solution in sight.

Name	Karen Scallan, Parent of Individual (22yo) with Autism and Down syndrome
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Increase in seizure disorders during puberty caused issues in our school because school was not knowledgeable of this increase in diagnoses at this age and they were not prepared with enough nurses available at the middle school level; sleep disturbance is extremely important and significant. Leads to other problems with behavior, health, desire to eat, increased depression, etc. Weight gain after exiting traditional school and not having as active a schedule.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Not enough therapists who understand neurodiversity/Autism and can provide appropriate therapy like trauma informed care or grief therapy; Not enough psychiatrists and long waits when you have to get a new psychiatrist for med management; not enough training for parents (early on) and school professionals in positive behavior support and how to identify what is a behavioral health issue and what is a lack of communication issue.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Regarding communication, schools give up too early on teaching whatever form of communication (device, sign, picture symbols, combinations) that the individual with Autism can learn. If they don't learn it fast enough, they just give up. Schools also don't provide enough communication devices and often bog down parents with agreements they have to sign that if it breaks they will pay for it.
What additional research is needed to help address co-occurring conditions for autistic people?	Lack of training and care in schools around behavior, communication, interaction in general. The research is there on what to do, but no one is researching just how bad the situation is and it is significantly bad.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Create incentives for states to recruit and retain psychiatrists that are Autism, trauma and grief informed; Create incentives for schools to take advantage of training opportunities ; funding opportunities for schools to use to train all school personnel; create incentives for middle school schools to hire additional nurses with caveats around number of nurses available per number of students with neurodiversity (both identified in IEPs and those under 504 plans/medical diagnoses of Autism).
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation was profound and lead to depression in many.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	There are still disruption in services such as day habilitation and significant reduction in ability to hire. Wages are increasing in other sectors syphoning off good personnel that we could previously hire. Individuals who are in self-directed waiver services, those using agencies for care needs and agencies that operate day habilitation centers are all vying for the same workers and all are having grave difficulty in hiring. Wages need to be increased through Medicaid waiver programs.

Name	Karen Weigle, National Center for START Services and Chattanooga Autism Center
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Chronic illness leads to loss of income/work, loss of social support, and early morbidity. I have seen a high rate of stage 4 GI cancer leading to death in people in their 40's in this population; factors to consider include lack of close health care, unhealthy lifestyle habits, impacts of trauma and marginalization on health.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Our research indicates high levels of anxiety and depression as well as trauma-related disorders, all of which go unrecognized, misunderstood and misdiagnosed (and therefore ineffectually treated), or mistreated, both in regard to medication and outpatient mental health care (counseling, etc). Mental health care for his population is sorely lacking and many providers report "not having expertise" or knowing what is evidence-based and effective for people with autism. Outcomes related to this include: poorer health (often caused my medications and over-medicating), further traumatic experiences, worsening mental health, loss of vocation and income, loss of relationships, and earlier death.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Marginalization has a major impact on wellbeing; people having low expectations of you, leaving you out of decision-making and not being active participants in your own care and life decisions has major impacts on your sense of self, health and wellbeing. The same poor outcomes listed under the medical and mental health questions also apply here. All areas of life are impacted by how people are treated on a daily basis in their communities as well as by health providers, and how much self-direction people experience. Further, many school systems are not equipped to meet federal guidelines for adequate accommodations to ensure each student meets their potential. Lack of understanding, funding, knowledge, and acceptance all impact this.
What additional research is needed to help address co-occurring conditions for autistic people?	More research on all areas discussed is needed. We need to include people with autism in research design and implementation to ensure that what we research is important to the people we are "researching." People with autism should guide the research questions and design, as well as be asked to participate.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All examples you listed are important. Another critical factor is including people with autism in designing improved supports and services; listening to their input and guidance and using it drive change. People with lived experience are our best allies in doing this work, and many would like to do it themselves. We need to do better at ensuring they are included and driving this work to ensure the "rest of us" know what is needed/wanted, rather than using our own biased lenses.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Our research indicates it parallels that of the general population with the caveat that the worsening of mental health is both more common and more intense for people with autism (as was the case pre-pandemic). We must remember that physical pain and emotional pain are biologically the same and that we must use multi-modal approaches to treat it, with less reliance on medications and more on building PERMA (a positive psychology term first defined by Seligman, which outlines "ingredients" necessary for health and wellbeing: Positive emotions; Engagement; Relationships; Meaning; Accomplishment) through a variety of possible supports and/or treatments.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Many people report positive outcomes around use of telehealth and remote engagement as normative (or at least more available); we need to ensure those remain available and covered by funding entities, especially for those who have other challenges to using in-person only services. More research is needed (and being done) on when and for whom and for what services telehealth leads to equal outcomes.</p>
---	--

Name	Karey
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Digestive issues- constipation, sleep disturbances, Skin irritations (when washing is a struggle), teeth and gum issues (when tooth brushing is a struggle)
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological Demand Avoidance causing anger, stress, anxiety and depression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	PDA causes developmental disabilities and communication disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Research into PDA
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kari Johnson
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory difficulties, hyper flexibility.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Autistic burnout, ADHD, anxiety, cptsd (which is not recognized in the united states yet). Also, how ADHD, anxiety, and autism are difficult to manage without exacerbating at least one of the conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Ability to care for oneself or work without much support.
What additional research is needed to help address co-occurring conditions for autistic people?	Autistic burnout.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Right now it's very difficult to get disability even though most people with autism can't work. Functioning in autistic people can vary wildly and can't hold a job even though they might seem like they can at first glance. There are not enough social safety nets in place and there are enormous barriers in place to access what little support does exist. I struggle to get through all of the red tape because it's very confusing and causes meltdowns.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None for me personally.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The cost of living crisis and being denied disability even though I can't work has caused me to become suicidal at times and feel like what little life I'm capable of might not be worth it. I like being able to have telehealth appointments.

Name	Kari Knutson, PathPoint
Demographic	Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	I would like to comment on the autism research possibilities. I work with a mix of disabilities and autism is one. I feel that the number one piece of the puzzle that needs to be addressed for autism is communication. As professionals, we need to look into ways to assist people with autism to communicate with who and what works for them. My program is vocational and a simple "good morning" can be triggering for some people. The multi layers of others voices and sounds, make what seems to us a simple action, a sometimes horrific moment for those with autism. In addition, finding jobs that meet the communication barriers and needs of people with autism is in high demand! Thank you for reaching out to those of us who work with people with disabilities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Kari Schaer
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Demand avoidance, mood disorder, Pathological Demand Avoidance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression, meltdowns, depression, anxiety, ADHD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Dyslexia, dyscalculia, dysgraphia
What additional research is needed to help address co-occurring conditions for autistic people?	Medication for PDA autistic children, appropriate and effective therapy for PDA autistic children, defining PDA vs DMDD in the DSM 6, determining if PDA is stand alone or a condition within Autism or a condition within ADHD.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, provider accessibility (both diagnostics and therapy). We would also love family therapy at home (that is not ABA) to support our autistic child's struggle with demand avoidance and meltdowns. School systems are not set up to serve this community. Schools do not have the resources or knowledge to support autistic PDA kids who have the ability to mask their symptoms in public, and then meltdown all evening/night.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It's hard to know how we'd be without Covid, but I see so much more anxiety in my kids than I ever experienced.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	More acceptance in not showing up. More mental health acceptance in societal norms.

Name	Karoline Moxham
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Stomach related issues. My 2 ASD kids suffer from reflux and IBS related issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anger management & anxiety are the most significant challenges. My youngest suffers from both depression & anger management; it has been difficult to get the right treatment for him. It's a never ending struggle.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities are challenging, because on the surface, my son appears typical. People don't understand that it takes him a bit of time to process information. Society is not tolerant of that.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More services particularly as they age out of the school system; better insurance coverage.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kat
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I have several autistic family members, and many of them really struggle with sleep disorders. They don't get enough sleep, which causes all sorts of long-term health risks and issues. My husband has comorbid ADHD, and his sleep issues complicate his attention issues and put him at huge risk for accidents and for long-term health complications like Alzheimer's. My son doesn't get enough sleep, despite his 90 minute long sleep hygiene routine and everyone working together to help him sleep. He's a young child, still growing, and we just cannot get him enough rest. I worry for him.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD in combination with autism is something two of my family members experience. It makes everything more complex to address, and finding ways to compassionately treat both conditions would help them so much.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	It makes helping them, empowering them so much harder. So many people demand that autistic folks communicate like neurotypical folks, putting a huge barrier between them and the treatment they need
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	STOP making them communicate in NT ways. It's so harmful.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kate D
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues, gastrointestinal problems, anxiety, depression, delayed sleep cycles, chronic pain, chronic fatigue, ADHD, memory issues, low libido, low energy/motivation, audio processing issues, POTS, hypermobility, disordered eating
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, ADHD, memory issues, emotional regulation issues, pathological demand avoidance
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Trouble navigating social situations, dyscalculia, dyslexia, trouble verbalizing thoughts and feelings, trouble with interoception, disordered eating.
What additional research is needed to help address co-occurring conditions for autistic people?	Genetic testing, physical testing, researching the link with hypermobility and POTS
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I feel it made my physical symptoms worse
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I believe the increase in remote work and health options has been positive and helpful for autistics

Name	Katelyn
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Having gastrointestinal issues causes a lot of problems when in at work. I end up taking a lot of time out of my day for this issue and it's really distressing. I also have sleep disturbances and that causes me to be extremely exhausted starting my day and it causes a lot of issues at work and making mistakes because I'm so tired. Sensory challenges were also a huge factor when I was a teacher and couldn't function with all the noise and had to take time when I should have been working to calm down.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I struggle a lot with depression and it's hard to get out of bed and a lot of times it ends up with me being suicidal because it gets so bad. I have no motivation and I can barely get a shower let alone work a whole day successfully. I also have ADHD and that is a huge struggle as well. I can't concentrate on getting my basic needs done and I can't even focus on my hobbies most of the time. I also struggle a lot with executive dysfunction and it's really tough getting anything done.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I have dyslexia, dyscalculia, and ADHD and it makes it hard not to procrastinate which causes my anxiety to get bad and I get so stressed out I end up throwing up. I also have trouble with math and can only do multiplication up to 5s and I can't add multiple digits in my head. Dyslexia also makes it difficult to read and speak. I stumble over my words constantly when speaking or say the wrong thing.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need better access to insurance that's a given. Having accommodations at work is also a struggle. Companies with employers need training and knowledge on autism and co-occurring issues so they know and understand why they need accommodations.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I've has much more issues with memory and brain fog and it's made my learning disabilities worse.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I haven't been able to reap the benefits of the things mentioned above.

Name	Kathleen Meyer
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Impulsivity and sleep disorders come to mind. Having to watch someone every minute of every day to keep them out of harm's way is exhausting. Many families do not have the means or the opportunity to get help or relief to keep their loved ones safe. With sleep disorders this makes them unsafe even overnight.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	There are multiple challenges with many of our loved ones on the autism spectrum. Our first hand experience is observing anxiety, attention, deficit hyperactivity disorder, complete with auditory processing issues and impulsivity. Compounding all this is the lack of understanding outside of the school systems to accommodate the safe functioning of these adults.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Because of the multiple layers of impairment that include intellectual, developmental, self control communication and sensory differences (impairments) these innocent people are at high risk of abuse by everyone from caregivers to our legal system. It is a very scary world every day for families with loved ones with autism. Our higher needs adults are not represented in the "not about me without me" as they need proxies to speak for them. The low needs autistic people do not represent the high needs group.
What additional research is needed to help address co-occurring conditions for autistic people?	Research desperately needs to include the whole spectrum of autism. Currently about a third are left out of consideration for their needs or even research about the natural course of their lives and function. The co-occurring condition is severe disability that threatens safety and prevents true independence. To pose this as co-occurring conditions may be helpful for a researcher designing questions but feels far from the reality of our high needs population. DD/IDD is believed to be 20 to 40 percent of the homeless population. Many autistics are evicted because of their autistic issues. The incidence of IDD/ DD in the prison population is approximately twice the incidence in the general population. Research in housing issues and incarceration areas would be helpful as well.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	There is no housing vision for autistic adults with high needs. There is a shortage of affordable housing and a shortage of caregivers. A second significant number live with parents over 60 years old. Many are nursing home level of care but no nursing home would take them or care for them. Many of our adults can't wash themselves or brush their own teeth. It is difficult to get a haircut, doctor visit, dental cleaning. The questions of co-occurring conditions does not begin to touch on the challenges. What co-occurring condition makes it so difficult to cooperate with a physical exam? What is your definition of autism? In this spectrum some have relatively mild sensory issues, while others are debilitated by them. Is this a co-occurring condition or are you including it in the autism diagnosis? This line of questioning is not straightforward and will be of limited value to most people on the spectrum.
What lasting impact has COVID-19 infection and illness had on co-	I don't know. We were able to isolate and vaccinate.

occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	We were fortunate that some of our son's usual people came to our home dinner the pandemic. This was valuable. Other changes in routine were very painful. Work skill training came to a halt

Name	Kathleen Walker
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	From my personal experience, sleep has always been a significant challenge. I also have Type 2 diabetes and sensory issues make it harder to manage my diabetes. For example, it's difficult for me to get blood tests done and I can't tolerate many vegetables due to texture issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have experienced anxiety since I was a teenager. Recently, I learned that much of my anxiety is related to complex trauma, which stems from my experience growing up autistic and how my family responded to my disability. I think one of the biggest challenges is that many mental health professionals don't understand how autistic people are likely to experience trauma or what therapeutic modalities will be most helpful for autistic people. For example, a few years ago I learned that many autistic adults feel cognitive behavior therapy doesn't "work" for them. Even though I'd interacted with the mental health system since I was a teenager and even studied psychology in college, I'd never heard this perspective before. It would be helpful if therapists could have a deeper knowledge of autism so they could guide patients (even those who are undiagnosed) to the most helpful type of therapy.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	I would like to see more research about -sleep: identifying better ways to deal with insomnia or other sleep issues -mental health: identifying the most effective approaches for supporting autistic people who are struggling with trauma, anxiety, depression, or suicidal ideation -chronic illnesses: identifying ways that doctors can support autistic people who struggle to manage chronic illnesses like diabetes because of sensory issues
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Patient-provider interactions: -Make sure providers have an up-to-date understanding of autism and don't make assumptions based on stereotypes. For example, a provider once asked if I really believe I have autism. This was our very first interaction so I can only assume they were making assumptions based on my personal info (e.g., that I live alone and have a full time job, etc.). I think it would be helpful for providers to have some education from autistic people with lived experience, including people with different needs and perspectives. -Educate providers about what sensory issues look like, how they may affect patients' ability to care for their health, and solutions that can help. For example, I found that using a continuous glucose monitor has been really helpful in managing my diabetes, as it would have been very hard to cope with daily finger sticks. It would have been great if my doctor had proactively suggested a CGM as an option (I had to research it myself and bring it up during my appointment). If dietitians or nutritionists could have training on sensory issues, this would also be very helpful for autistic people managing chronic illnesses.
What lasting impact has COVID-19 infection and illness had on co-	

<p>occurring physical and/or mental health conditions for autistic people?</p>	
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Remote work and the increased availability of telehealth have been helpful for me. The reduced demand on my energy and having access to therapy via telehealth have contributed to a big improvement in my mental health. However, I feel that the COVID-19 pandemic revealed longstanding ableism in our health care and public health systems, and that has been detrimental for the mental health of disabled people overall. For example, policies that prioritized "getting back to normal" while downplaying the importance of protecting others sent the message that disabled people's health is less valuable. Since many autistic people have co-occurring conditions this messaging hit close to home.</p>

Name	Katie
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD: having my ADHD and autism constantly at war with each other. It becomes incapacitating. Anxiety: I am constantly socially worried about being “normal” enough PTSD: I struggle with meltdowns already. PTSD has really harmed my already difficult experience of regulating my emotions and irritability.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research on how Autism and ADHD present when someone has both. It can look like one compensates for the other and then we get missed until adulthood. Also more research on women/girls, trans, and non binary people. I think this would help a lot of us be noticed sooner than someone who only has autism. Also PTSD and autism occurring together.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Mental health services covered by insurance better (I have Medicaid and almost no one is covered especially anyone who is educated in autism or trauma). I have so many therapists that have told me they’re on the waitlist for Medicaid and it’s so frustrating Medicaid won’t allow more providers. Also making all mental health providers (and doctors if possible) take courses on autism ESPECIALLY on what low support needs autism looks like.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Burnout from going back after a break. I miss the flexibility of working from home and going in. I now feel like I’m always burnt out and overstimulated. It’s like I notice my autism more now because I stopped training for a year.

Name	Katie
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son and I both have trouble connecting with and using our muscles effectively. When we walk, we tend to just move our bones through space, instead of properly supporting our frame with flexed and toned muscles. This led to numerous joint problems and long-term chronic pain. After 1000 hours of yoga, I finally understand how to move.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Because symptoms of autism can overlap those with ADHD, OCD, bipolar, CPTSD, and other mental health conditions, it is <i>*very*</i> difficult to get treatment that actually helps. None of my formal diagnoses tell the whole story, and some accepted treatments (like ERP for OCD, or stimulants for ADHD) have actually done more harm than good. I went to psychiatrists for ten years before I got an autism diagnosis, and it was only because I took the test on my own and brought it up with my doctor. Now I have meds and therapies that work for me, but I am still unraveling years of harm.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	What treatments are actually effective, long-term, for <i>*holistic*</i> betterment (not reduction of a single symptom)? How does the diagnostic model (and poorly-educated doctors) fail people with complex needs? How many false or secondary diagnoses do people receive before they get to a label and treatment that actually helps? How does autism change mental health crisis signs? What does a manic episode look like for someone with an autistic brain? What assessment questions need to be altered, so doctors get a clear picture of what is going on?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autism testing costs a lot of money, even with insurance. My son needs accommodations for school, so we needed to pay a lot of money that insurance didn't cover. My son's brand new school building looks beautiful but is a nightmare for autistic people - loud and massive, with tall ceilings that echo sounds. No quiet spaces or breaks available for him to decompress during the day. His teachers won't even let him step into the hall or wear headphones. These are simple, human quality of life things that everyone needs - but if my son doesn't get them, his grades and behavior suffer. Doctors need to ask better questions on assessments. "Do you struggle with racing thoughts?" Is a difficult question to answer. "How many times a day do you feel like your thoughts are uncomfortably fast?" Is much easier. I always want to answer a question, "it depends - what do you mean?" And that isn't allowed. If someone is born with severe autism, their life is immediately very difficult and expensive. Parents of autistic kids need more physical supports - childcare, food, accommodations from work. It can be devastating, and it affects an entire family.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I really love working from home and using telehealth. It's much easier than going into public spaces. Even grocery ordering saves me a meltdown.</p>
---	---

Name	Katie DuPree-Magat
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances and executive dysfunction make it hard to keep an hourly entry level job. I and my child thrive in environments where the quality of the work is what matters and we can complete it in our own time, such as in salaried positions. Sensory issues and low social battery make me require shorter but more frequent vacation times. For example, taking a 4-day weekend once a month as opposed to a 2 week vacation twice a year.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	These can make us more prone to disregarding our needs until we meltdown or burn out. OCD can make it harder for us to form relationships with allistic people who see us as weird because they do not understand our behaviors. It can exacerbate executive dysfunction challenges. We are more likely to require maintenance medications and services as in for ADHD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Continue research on autistic presentation differences in adults. women and people of color compared to affluent, white little boys. Less abusive treatment alternatives to ABA. Continue research on overlap between ASD and ADHD.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to diagnosis and coverage for OT, PT and Speech.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Showed us working in an autistic friendly way (from home) is possible and benefits the many people, not just Autistics. Companies just need to be held accountable to keeping these accommodations.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	See comment on previous question regarding work from home.

Name	Katya Siddall-Cipolla
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Many co-occurring health issues are invisible disabilities, and autistic people may explain or experience symptoms differently than allistic people. Most doctors are completely inequipped to pick up on differences in symptom presentation due to sensory or communication differences.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Misdiagnosis of autism as depression or bipolar disorder.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The assumption that all autistic people have learning deficits, which excludes many autistic kids from diagnosis early, as well as the lack of understanding that autistic people can be highly gifted intellectually but still have deficits that need support. There are many gifted autistic folks who are also dyscalculic or dyslexic, but do not get any support because they're "smart."
What additional research is needed to help address co-occurring conditions for autistic people?	Research on adults, specifically those assigned female at birth, and inclusion of autistic parents in studies about children. We know nothing about autism and perimenopause, for example, but this is one of the hardest times for women with mental health and co-occurring conditions.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	ELIMINATE ABA COVERAGE REQUIREMENTS. Payers will not cover more beneficial services because they meet the regulatory requirements by only covering ABA, which is abusive and not affirming.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	There is a much higher rate of long COVID in this population, and people who were able to work and enjoy life are now almost completely disabled. It's a public health crisis.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth access has been a godsend, and remote school has been so helpful for our family to help reduce burnout in our child. It makes me sad to see so many beneficial policies of COVID be aggressively rolled back, like remote work.

Name	Kay
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I personally feel like the pain experienced from these conditions are amplified due to my autism and others don't understand that and think I'm overreacting.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Similarly to the last question, I feel that the hard parts of these conditions are amplified from my autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The hardest challenge caused by these conditions is that the majority of day to day activities in life are more configured to those without these conditions, leaving those with them alienated.
What additional research is needed to help address co-occurring conditions for autistic people?	I feel that reading different challenges faced by autistic individuals from reliable sources and how to help others with ASD can help.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I personally feel it's more complicated to socialize as an autistic person after the pandemic as the isolation hurt my ability to socialize in person.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The lack of a need to interact in person for most jobs due to working from home can be helpful for those who have trouble with socialization.

Name	Kayla Weant
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory hyper/hyposensitivity, communication differences, sleep disorders
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, anxiety, depression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication differences.
What additional research is needed to help address co-occurring conditions for autistic people?	Updating the diagnostic criteria to better include girls, women, non-binary, and people of color. Look into the lasting harm of ABA therapy on the mental health of autistic individuals.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Lower the barrier of entry for adults, AFAB individuals, nonbinary individuals, and people of color to access diagnoses. STOP recommending the use of ABA therapy as the default treatment for autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increased anxiety and depression
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kayn L
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Hypermobility Syndrome: chronic moderate to severe pain in hips, knees, lower leg, back, elbows, and wrists
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD-C: medication makes autistic traits more apparent opposing stimulation, sensory, and energy needs, executive dysfunction and motivation issues Bipolar disorder type 2: co-occurring depression Bulimia: food, texture, and routine issues slowing recovery
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research into comorbid biological and psychological conditions unrelated to a biological or psychological cause for autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More and easier to access services/testing for adults, especially those covered by insurance (state run and private)
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kd
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory issues Seizures / epilepsy Genetic conditions Gastrointestinal disorders Migraines
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD — rejection sensitive dysphoria OCD Anxiety Depression Suicidality
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Dyslexia Social communication disorder sensory processing disorder Developmental disabilities— sometimes genetic disease linked Sensory processing disorder
What additional research is needed to help address co-occurring conditions for autistic people?	How these conditions overlap, how the symptoms differ, rates of concurrence, if there’s a genetic basis, difference between and alignment of autism and genetic conditions that mirror autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Improved patient and provider interactions for autistics with limited verbal language Equitable access to augmentative and alternative and communication devices— too much gatekeeping by service providers and lack of knowledge based on community, access, and privilege Equitable access to services based on geographical location How do we support those with genetic conditions which parallel autism? Do they also qualify for autism? How do we get providers and doctors on the same page about this? We need non behavioral based/ ABA treatment options for autism like Floortime, play therapy, etc. We need more public integrated preschool programs. In districts where there are limited spots (which is many) with the money For an advocate, get the preschool spots. That’s inequitable.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Autoimmune conditions, long covid, fibromyalgia symptoms are often worse for autistics. These have gotten worse with repeat covid exposure
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased isolation; emotional dysregulation; lack of community connection could lead to worsening mental health conditions; remote services often offered first/ more available even when that’s not what is best for the individual; increased sensory issues

Name	Kelley, parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The inability to get medicine in a preferred form, such as having a sensory aversion to pills, yet cannot find medicine in any other form.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	1. Focus is in stopping the behavior instead of fixing the problem, or finding an alternative. 2. Society's view that problem behaviors, such as not paying attention, are something the person just has to learn to overcome, or that what works for a NT person (like a day planner), will work for the person with ADHD. When all it does is add another thing to do.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	1. In regards to intellectual disabilities, it is labeling people with severe IDD as severe autism. They may have autism, but the IDD is the significant issue. Not labeling the disability correctly tends to lump them in with everyone in the autistic population, and the strategies are often vastly different. 2. Helping with communication disabilities is too often focused on verbal communication, instead of all forms of communication. 3. Too often, the people helping are focused on what needs to change per their perspective.
What additional research is needed to help address co-occurring conditions for autistic people?	How the labeling of the disability affects the outcome and services. With everything being lumped under autism, research and services tend to lump very different disabilities together.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kelli
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Getting overwhelmed and overstimulated very often. Eventually causing burnout and lots of stress on the body/mind.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Quality of life is poorer (or not being able to enjoy it fully), job difficulty with certain jobs causing extreme anxiety, difficulty communicating with coworkers and romantic partners, parenting is extra challenging, difficulty with friendships, people not believing or supporting you. Not enough mental health professionals that specialize in ASD. Or can't access the needed services as an adult.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Thinking differently, processing language differently, needing more accommodations etc in school. Having hard time articulating feelings and thoughts to NT people.
What additional research is needed to help address co-occurring conditions for autistic people?	More research is needed on women/girls with autism and co-occurring conditions. Also how not getting proper support early in life leads to these issues in adulthood. More on genetics and generational trauma and how that plays into it. How pregnancy affects autistic brains. And parenting as an autistic individual. And more psych training on how to support autistic people in therapy as we don't respond to same methods as well it seems.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage! Mental health services should be fully covered for autistic adults and the adult assessments as well. More teachers, psych professionals, and medical professionals need to be trained on supporting and caring for autistic people. Especially women and those who are high functioning because we are often missed/dismised. More supports for autistic mothers and parents. And more spaces for autistic people of all levels to find info, services, and friendship.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I don't have evidence, but my memory and anxiety/depression is much worse since having covid. And I'd assume it also has made my immune system worse. My knee joints also hurt for a very long time after covid.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive changes. Working from home has been life changing and helped quality of life so much. Much less anxiety about work. Like the not interacting with people as much and having to mask all the time is wonderful. I can take my time and make the work day how i want it to be. Don't worry about getting sick as much in the office.

Name	Kelly
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Difficulty falling asleep, audio and visual sensitivity, especially in places with fluorescent lights,
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, depression, postpartum depression, PMDD, ADHD (medication helps tremendously), cutting, alcohol use disorder, suicidal ideations
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities, social interaction disabilities,
What additional research is needed to help address co-occurring conditions for autistic people?	Research on the efficacy of assigning social workers to “functioning” autistic adults. I feel everything so intensely that it can become overwhelming. I just need someone to metaphorically hold my hand sometimes.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Social workers for autistic adults who are self-sufficient but could burnout at any time
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Severe anxiety and hypochondria, panic attacks, burnout, Raynaud’s Syndrome, tachycardia, increased sensory issues
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kelly Howard
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Many of the co-occurring health conditions in autistic people cause aggression towards themselves, known as self-injurious behavior; or others like close family members, teachers, and therapists.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many of the co-occurring mental health conditions in autistic people cause problems with memory and retention of skills learned; if they're even able to be taught.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	One of the most significant challenges caused by communication disability or developmental disability in an autistic individual is that they are not able to be tested on what they actually know. Expressive language is so low that you'll never know how much that person actually understands about the world or how they feel.
What additional research is needed to help address co-occurring conditions for autistic people?	As the mother of a nonverbal autistic child with a developmental delay, I'm actually not sure what needs to be done on a research level. I can tell you that as far as the medical community is concerned, including therapists, they need to listen to the parents more and stop throwing out the excuse "oh that's just autism."
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	My son's therapies were disrupted and his therapists were changed due to fear of cross-contamination of some kind. My son had a huge problem with the masks, as they block out social cues on somebody's face. It took him over 6 months to finally wear one but returning to school without the virus completely under control and having to go to school with a mask, started the ball rolling for me to completely withdraw him and homeschool.

Name	Kelly King
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GI, lung differences, microbiome differences, lack of dental - particularly sedation dentistry, sleep issues, sensory and motor issues, intense behaviors of properly destruction, aggression and SIBs, speech and apraxia. Practitioners of all types commonly lack genuine care, flexibility and willingness to serve those with severe ASD, recognize underlying conditions, and to treat them holistically - they are unprepared. Diagnostic overshadowing is common and procedures, labwork and appointments can themselves be problematic. Facilities are ill-prepared to address the sensory, daily living and behavioral challenges. Hospitalizations add another layer of problems. Access to services, quality of life for the entire family, and health equity are all compromised. Waits for diagnoses and services can be long. School MH supports are variable and usually inadequate. Psychiatry, nursing, and density are a challenge; sedation dentistry means a year's wait. RTFs and ICFs have no space. Group homes are rife with abuse and neglect with low quality, poorly trained staff, lack transparency, and internal BS and incident handling are flawed. Group home to exclude and villainize families is commonplace.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	All of the above and trauma. Psychiatry has become psychopharmacology and the hypersensitive virgin system doesn't always deal well with the host of drugs prescribed. Psych hospitals add diagnoses - reportedly for insurance purposes - and meds for which other meds must be added to deal with side effects. It's the old throwing spaghetti and seeing what sticks idea; there seems little clarity on what will be effective for this population. Drug trials are often left to do in the family home.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	All of the above The shift of the childhood autism "developmental disorder" into the realm of labeling it a mental health condition simply because the individual turns 18 is concerning. Adulthood does not change history nor erase the developmental difficulties. A developmental disorder that persists into adulthood is no less a developmental disorder because one had a birthday.
What additional research is needed to help address co-occurring conditions for autistic people?	Much - with a focus on severe population. Physical lung differences; are there other physical differences Documented microbiome differences, how can these be addressed? Treating intense behaviors in effective ways. Medication research. Causal factors for common co-morbidities and how to treat effectively. ACEs, trauma and effective treatment (particularly to the non verbal) Investigative research, including surveys of staff, residents, and families around abuse and neglect, etc. in residential facilities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Best practices are set aside at 18 - unless you are incarcerated. The neurodiverse fad backwaters the severe and nonverbal. Spelling to communicate is discredited leaving many without a voice. Trauma abounds with few of any skilled therapists to help the severe and nonverbal. Issues abound, the population increases, we're missing the mark.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID left a mark: learning loss, ineffective remote instruction and telehealth, lack of exercise, isolation, habituation to the home and loss. Some have yet to leave their homes. Fears persist. Needed residential services (RTFs) were unavailable and remain so. Therapies ceased so treatment stopped. Teletherapy was most often ineffective and individuals disengaged. Is there effective grief counseling? Those in group homes were

	cut off from their family, many could not communicate and quality of care is questionable across the time period. Disruption of the schedule and routine precipitated an increase in MH issues.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruption in services Availability of telehealth, sometimes good, sometimes bad but available. Learning loss Job and skill losses Staff shortages and loss of support. Isolation, decreased social connections Supports systems cut off

Name	Kelly L. Nimitz-Rusch, DNP, RN, The Autism Collective
Demographic	Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	lack of understanding/education regarding what co-occurring conditions to expect/look for and how to treat effectively causing delays, under treatment or no treatment lack of care coordination of the co-occurring conditions lack of access to the services
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	lack of available services to manage co-occurring mental health conditions and support to families/caregivers we are seeing high number of children, young adults taken to the ED (family feels unsafe or the residential home they are living in feels outbursts cannot be managed). They are then boarded or inappropriately placed on an inpatient unit (not behavioral health unit) because there is not a safe discharge plan. There are no available beds at appropriate facilities (or facilities saying they are unable to take them because of their autism). We have seen autistic individuals in hospitals for months waiting for appropriate placement. It is horrific situation.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of appropriate IEPs or adherence to IEPs Teachers tell us they have not had enough education on autism to understand how to best address or management within the classroom setting Classroom aides or assigned 1:1 have not had education on autism and while well-meaning often utilize interventions that exacerbate the behaviors rather than help. Lack of sensory or calm rooms in schools
What additional research is needed to help address co-occurring conditions for autistic people?	There is a need to identify individual autism genotypes that could assist in predicting symptom subtypes. This could inform targeted interventions for specific symptoms that much earlier.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	From my perspective there is a much needed overhaul in this area. The current healthcare system is not designed to address autism. There is a lack of support, access, knowledge, insurance coverage to support an autistic individual through the lifespan. We have a piecemealed system.... autism impacts each part of the co-occurring condition. The individual may have severe communication limitations impacting his/her ability to appropriately communicate stomach pain which may lead to delayed identification of GI issues. GI issues can directly impact sleep, and exacerbate behavioral and psychiatric disorders. While it is great to have autism centers, we need to transfer this level of healthcare expertise beyond the centers. ECHO Autism is a start but we need transfer of knowledge that provides the means for physicians, APNs to diagnose with confidence and understand the co-occurring conditions that should be considered. They need access to experts (physician to physician consult) so that patients can be managed by primary care with the comfort of know they have access to experts with a phone call. We need to think of out the box and identify way to expand access and ensure insurance coverage is there to support the interventions/care needed
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Not entirely sure we know at this time. We believe there was a delay in diagnosis as many of the gold standard diagnostic tools could not be administered with masks on. Needed early intervention services were delayed and early interventions result in better outcomes. As routine and structure is often important regulating factor, many found autistic individuals suffered from severe dysregulation, inability to understand the change in routine, and frequent meltdowns. This impacted the family structure as many were ill-equipped to handle this level of meltdown on daily basis.

What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

Name	Kelly Tabeling
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Accessing education in a school environment
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Accessing education in a school environment
What additional research is needed to help address co-occurring conditions for autistic people?	Pathological Demand Avoidance is an area that desperately needs further research. We have had a very hard time finding a provider who understands the unique profile of PDA, which makes it hard to get an autism diagnosis and the necessary services.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More education for teachers and providers.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Ken
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I do not know if this is related to autism, but I have three autoimmune diseases: Crohn's Disease Celiac Disease Type 1 Diabetes I attribute my autistic focus to learning the mechanism of action for each of these diseases in order to manage them to non-disease levels. My methods do not follow the medical establishment, however, they are successful, resulting in symptom and complication free.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I suffer from anxiety, depression and suicidality. Each of these is primarily due to society's rejection and bigotry of my social differences from typical. As such, I am fine when alone. I would be fine socially also if my differences were accepted. Society is a very rigid component of the human species. Members of most non-human species accepts me as I am, making me comfortable in their company. Interesting that that never occurs with humans.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Throughout school, I was regarded as [redacted]. However, I am now retired from a very successful career as an electronics design engineer. In school, I was considered to have a learning disability. The reality is that I have no problem learning, however, I have a problem being taught. Being taught is a social process inducing social anxiety making learning very difficult. On my own, I can learn just fine. Verbal communication disability is due to my lack of control of my tone and expressions. The other person includes tone and expression as part of the communication, but I have no control of that. They always interpret something more than the words I speak, creating confusion and frustration. This is a known issue called the 90 percent rule.
What additional research is needed to help address co-occurring conditions for autistic people?	Greater understanding of the social interpretation which induces social anxiety. Anxiety can be very debilitating and physically compromising. Many autistic's suffer from extreme sensitivities that can result in unhealthy lifestyles such as food, etc. It can also prevent some health related hygiene activities. Social anxieties can prevent autistics from visiting health care services, etc.In my case, social anxiety is my greatest issue. If left alone, I can easily and successfully take care of myself. I sent my primary care physician a letter describing my autism. She actually read the letter and changed her interaction with me to prevent traumatic social anxiety resulting in a very calm, successful appointment. Basically, what's needed is more understanding and acceptance. It is so often considered that if someone is "different" they are defective and need "help". Typically that help, however actually makes things worse - confusing the helping professional.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	For service providers to understand and respect autistics and learn how to understand and interact with them. A high percentage of early diagnosed autistics are tragically taught to be debilitated. This is typically due to misunderstanding autistic responses, mannerisms, etc. It also results in debilitating anxiety for the autistic. The goal is always to fix them and make them behave like "normal" people. This never worked for me, but leaving me to be me resulted in my very successful career and life. Just let us be us. We can do fine, if you just let us and avoid pushing us which only elevates debilitating anxiety.
What lasting impact has COVID-19 infection and illness had on co-	For me, the COVID-19 lock down was a great relief. The solitude was a great benefit to me. The isolation helped me build the strength to get all the

<p>occurring physical and/or mental health conditions for autistic people?</p>	<p>COVID vaccinations, boosters and tests. As a result, I never got the virus or any symptoms.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The COVID-19 pandemic occurred after my retirement, so there was no work related issues. I found telehealth to be awkward, but functional. I prefer in-person visits as long as the doctor and staff understands and respects my autism and treats me accordingly. Reduced in-person social interactions and obligations was a benefit, dramatically lowering my overall anxieties.</p>

Name	Kendahl Damashek
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Nervous system disabilities presenting as behavioral challenges (Pathological Demand Avoidance), sleep disturbances (including narcolepsy), sensory challenges
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Pathological Demand Avoidance - behavioral expressions of this co-occurring nervous system disability, which is often misidentified as many of the listed mental health conditions, in addition to Oppositional Defiant Disorder and eating disorders, are incredibly destabilizing and disabling. Adaptive measures are also negatively impacted. This is made worse *because* PDA is understudied, and traditional guidance advises using behavioral modification strategies (like ABA or reward-sanction paradigms) that are contraindicated in PDA individuals and worsen the disability/push the autistic individual into trauma.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Many autistic people are gestalt language processors, but this is not taught in most speech pathology programs. Therefore autistic individuals are treated as though they are disordered analytic processors, when they actually have a different method of acquiring speech altogether. This means that resources are used ineffectively to apply moot strategies to the majority of autistic people with speech delays.
What additional research is needed to help address co-occurring conditions for autistic people?	Research on Pathological Demand Avoidance (see preliminary studies by Noelle Carlozzi at University of Michigan). It needs to be studied so it can be recognized officially as a disability and its parameters defined--for both internalizing and externalizing PDAers. Additional research also needs to be funded in Polyvagal Theory (Stephen Porges), which explains the suspected root cause of PDA. Research on gestalt language processing would also be incredibly helpful.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Many services are rendered through school districts, whose assessments target different goals than the actual autistic person wants. Respite should be provided to every family with an autism diagnosis, w/o additional bureaucracy. It has taken me years to finally be awarded respite; now that we have qualified (through OPWDD in NY), we are not given a case manager b/c my kids are too young. I have to do another application to receive funds I've already qualified for, after determining myself which agencies in my area are contracted. Pathological Demand Avoidance is not either heard of or respected by most professionals in the United States, so the guidance/support services offered--if at all--are inadequate/contraindicated. Insurance companies only cover ABA therapy, which the majority of autistic adults agree was abusive and traumatic for them. Diagnosis is a privilege; most insurance companies don't cover this, esp for adults, even though the diagnostic criteria in the DSM has changed since we were children. There aren't services available for "high functioning" adults. We have difficulty maintaining adequate work, but if we can't afford diagnosis, we also can't receive services/SSDI. Executive dysfunction is a symptom of autism, but the bureaucracy required to receive assistance is labyrinthian. Many people can't access resources *because* of their disabilities. Autism is genetic and it

	is highly likely that the parents of children needing support also need support.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Brain fog, inflammation that exacerbates diabetes
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kenneth Kaye
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal disorders are one of the most challenging physical health conditions that affect me, followed closely by sensory issues. They have an immediate and daily impact on my ability to function as required by society and the quality of my life.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, ADHD, and the sub-categories of Autistic expression such as PDA make being a functional human being a challenge on the best of days and impossible on the worst.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Issues associated with the expression of ideals and the definitions of words and their meanings are the most challenging from this "other conditions" category. It's damaging to my mental health and well-being to live in a society that claims to value and respect fairness, equality, honest, and doing the right thing when all experiential evidence indicates that none of those things are actually valued or respected, but rather mocked and disrespected.
What additional research is needed to help address co-occurring conditions for autistic people?	Research about the origins of, treatment for (which doesn't indicate medication alone), and accommodations for autism that doesn't have any preconceived notions inherent in the research about age, race, gender, or other factors and treats it like a first-class issue that deserves the full attention and respect of the researchers involved.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Universal insurance coverage for autism diagnosis (heck, Universal Health for all for that matter), laws that protect and defend the neurodivergent in the workplace, and process and system alternatives that allow for differing sensory experiences for equitable access to services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I don't have enough context to provide an answer for everyone, but for myself long term physical condition degradation as well as mental degradation are apparent, and affects me not only emotionally, but also in my ability to provide and care for myself.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The shift in the American workplace to remote for many technology-based jobs has been an incredible help for me, and people like myself, who get overstimulated in office spaces, who can't relax and focus in those spaces, and who get anxiety being around people. The improvements to telehealth, while modest, are also greatly useful and appreciated.

Name	Kerri Greig
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest problem is being listened to and having these co-occurring physical challenges acknowledged. I wish there was more understanding and acceptance. Poor sleep and hyper sensory challenges mean being wiped out: physically, mentally and emotionally and therefore overly wired and on edge. This makes interacting and relating positively with others an additional challenge.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For me and my family, it's running out of mental spoons that creates problems. For us, the anxiety (and some depression) is because it's just plain HARD to get through the day without feeling so depleted. It robs us of the joy of being laid back.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I don't like the term learning difficulties. If rather say learning differences. That's what suits myself and my family better. What would help, is to have explanations given in a logical sequence and then to go over it all once we have the whole story. So, maybe this will answer better - or is a significant challenge when information is presented in a way that only gives small pieces of information that seem irrelevant until afterwards. We need to know what info is the most relevant / important - and why. Knowing the 'why' can make a whole heap of difference.
What additional research is needed to help address co-occurring conditions for autistic people?	More surveys like this I imagine. Actually speaking with autistics who have the lived experience, and listening to all of our voices. It's only the people with lived experience that can be referred to as the real experts.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Administrative / executive function type of assistance. It's honestly so difficult to get through the red tape hoops and it's so draining, so some of us stop looking for official help or apply for services. And less feeling like we have to prove ourselves deserving of the help. Less judgementalism etc.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	No idea. I wouldn't think that would have such a significant impact as to warrant it's own question.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think the main positive changes are more access to online meetings / telehealth appointments (& them being considered more acceptable in general society). The other main impact for our lives was having the time for self reflection which resulted in us realising we are in fact autistic with ADHD, which we weren't cognitively aware of prior to that. We knew we weren't like most other people, just hadn't been able to get to the bottom of it.

Name	Kerry
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastro/metabolism of nutrients
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety, adhd
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disorder
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	My son spent nearly 15 years of his life suffering from anxiety and being medicated for anxiety at the highest adult dose. Only serendipitously did I discover that he suffered from low ferritin saturation-chronically. No doctor had tested this since his cbc was all within normal (though often right at the cut off number.) Once he began iron pills daily he was able to stop taking anxiety medication completely. His low iron status was causing the anxiety (and other problems) . Not one psychiatrist, psychologist or pediatrician tested his iron status despite it being a known ride along with autism and adhd. The government must mandate testing for known issues that co-exist with autism and recommend testing for immediate family, as well.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	None

Name	Kerstin Powell
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Other occurring disorders disrupts the patient's ability to self regulate. Sleep issues, anxiety, GI issues, even a common cold, can send an individual on the spectrum into a spiral. Many autistic individuals struggle to communicate discomfort, and, even if they can intimate that they don't feel well, they may not be able to tact body parts or conditions that are making them uncomfortable, adding to the communication frustration that manifests in maladaptive behaviour.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Many autistic people who have the official diagnoses are not treated for co-morbid mental health issues such as anxiety and OCD, depression and suicidal ideation. There is a tendency to see the autism diagnosis and pin everything happening with the individual on that ONE thing, despite evidence to the contrary. Pathological demand avoidance (PDA) and pediatric acute onset neuropsychiatric syndrome PANS/ PANDAS) are little understood to begin with, even moreso for individuals with autism.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	In my own experience, the mental health, learning disabilities, and, social communication challenges prevent many autistic individuals from being able to access care. Again, people see the autism and don't treat the co-occurring problems as a different set of problems for the individual.
What additional research is needed to help address co-occurring conditions for autistic people?	The institutions are 10 years behind the current research. A robust implementation of a sensible standard of care would be one thing, using research already done and getting up to speed with best practices is potentially helpful. Also caregiver support and helping families afford therapies that are salient would be nice.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to affordable healthcare. Coverage for ABA and other evidence based therapies. Access to affordable mental health coverage.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Everyone has mental health problems post covid. That whole thing did not have to happen, regardless, isolation and unpredictability, loss and pain, all of that has a negative impact on people in general. It was a struggle for everyone, worse for those who depended on their routines.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	All negative, disruptions in employment of caregivers leading to more poverty, not to mention the fact that people with special needs individuals in their families are hurting and struggling with basic daily needs. Childcare is a big issue with employment. Public schools are not properly equipped to deal with individuals with autism to begin with.

Name	Kevin Gerrity, Project Beacon TX
Demographic	Family member of an autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son is severely autistic/non verbal, and some of the co-occurring health conditions that he demonstrates include pica, self injury behavior, gastrointestinal disorders, (infrequent) seizures and inconsistent sleep patterns.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	To me, with my son, the most significant are the self-injurious behaviors and pica. While the others he displays (from my response to the previous question) are serious, these two are the most significant. He is rarely aggressive toward others and does not (currently) demonstrate any suicidal tendencies.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The most significant challenge is finding proper care and treatment that will allow him to become the best version of himself. My son can learn, and improve from these behaviors, but it takes time and the proper approach/treatment. He made progress while in his post high school special needs program but will age out this year and there are limited/no viable options post 21.
What additional research is needed to help address co-occurring conditions for autistic people?	There is all kind of medical and therapeutic research that can be done to help address/improve these conditions. Unfortunately, with autism, there is rarely "one answer" given the wide variety of issues and support levels in this community. At the federal level there should be a willingness to listen to parents and self advocates from across the spectrum to understand priorities and then work with private industry to launch some of these higher priority research opportunities.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	What (to me) is the most critical area for improvement is the post- 21 educational, vocational, social and (most importantly) residential opportunities for this population. It varies greatly by state, and even the most "progressive" states have backlogs, issues with the quality/pay of care providers, quality residential options, etc. We need to figure out where these guys are going to live/work/learn for the rest of their lives, after their parents pass, as a priority.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I do not have a view on this question...I do not see my son being impacted...more of an impact on the caregivers
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I think the biggest thing here is the disruption of services, and the slow rebound in getting quality staff back in sufficient numbers to support the population.

Name	Kevin Ryle, Association of University Centers on Disabilities and the Autism Society of America
Demographic	Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Research demonstrates that individuals diagnosed with Autism experience frequent gastrointestinal symptoms, and those symptoms are associated with “an increase in self-injurious behaviors, somatic complaints, reduced sleep duration, and increased parasomnias (Restrepo, et. al, 2020). Initiating sleep and being able to maintain sleep are known challenges for Autistic children, as is sleeping for excessive periods of time and night sweats (Romeo, et al., 2021). Epilepsy prevalence is much higher in the Autistic population than in the general population, and experts believe there to be a connection between the two disorders (Besag, et al., 2017). GI problems, sleep disturbances, and sensory differences all correlate with anxiety. Substance abuse and eating disorders have become more prevalent in the Autism community over the last few decades. While typically categorized as psychiatric disorders, these disorders clearly affect physical health and life quality when they co-occur with Autism.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For decades, mental health needs of individuals diagnosed with Autism have been misdiagnosed, ignored, and misunderstood. About three-quarters of children diagnosed with Autism meet criteria for one mental health condition, while one-half meet criteria for two. Feeling one must blend into a neuro-normative society – called camouflaging, or masking – may create distress that leads to mental health conditions, including suicidality (Cleary, et al., 2023). Females and members of the LGBTQ+ community have reported the distress they experience with masking. Several studies, including Cassidy et al. (2018) have found that Autistic adults are at significantly increased risk of suicidality. Co-occurring mental health conditions can exacerbate challenges for individuals in school, social relationships, independent living, employment, and personal safety. Crisis beds for those experiencing a psychiatric emergency are limited in most areas, and not available in many areas of the country. Emergency room professionals are under-trained in how to identify and support the mental health needs. People with Autism experiencing a mental health crisis deserve a mental health response. Some families must resort to calling law enforcement to help with a crisis. These situations too often lead to unnecessary incarceration, harm, or even death. Community-based programs rely on funding from programs like Title XIX Medicaid Home and Community-Based Waiver programs with limited funding (waiting lists).
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Schools are often not equipped with the tools or personnel to help a child who has Autism and a co-occurring disability to manage their behaviors, and this results in a lack of access to an education with their peers without disabilities. When children reach a “transition period,” their school programs set up experienced-based learning experiences, like going to work at a local organization. Children with challenging behaviors are often not included in these learning opportunities because the businesses that contract with schools will not work with students. Students with Autism and behavioral needs are not given the same opportunity to learn about independent living skills or employment. Students with Autism and co-occurring conditions are often subjected to outdated discipline guidance, causing them to miss critical points in their education. Restraint, seclusion, and school dismissals are practiced around the country, and cause students to miss class time, thus falling behind in their education. Individuals with Autism and co-occurring intellectual and mental health disabilities too often end up in the criminal

	<p>legal system. Social and communication challenges present significant barriers to navigating legal proceedings as an Autistic person, and courts generally fail to consider Autism a mitigating factor in proceedings. This is especially true for individuals with Autism that intersect with BIPOC communities.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<ul style="list-style-type: none"> •Psychotherapy is not often available, nor is it effective when attempted. Counselors are taught to develop a therapeutic alliance through social cues, open-ended questioning, and reciprocal dialogue. This maybe a significant challenge for people with Autism. Identifying effective psychotherapeutic techniques is an important area of research, as is counselor education about Autism and effective therapeutic strategies. •More research into sexual and gender identity in the Autism community is needed to support health. •The needs of females diagnosed with Autism need to be better identified and understood. •Employment-related research, such as how to make the workplace “Autism-friendly.” •Strategies for effective transitions into adulthood, especially in rural areas needs more research. Research into using modern technology to better facilitate employment, housing, education, etc. – especially technologies and strategies developed after the pandemic – should be a priority. •A national task force of experienced clinicians should be created to develop a Gold Standard protocol for diagnosis. •A new intervention research network focused on communication needs, in particular, alternative augmentative communication (AAC) should be created. 25-30% of individuals are non-speaking or minimally-speaking. Individuals need access to communication assistants and/or devices. Additional research to develop evidence-based AAC devices and methods.
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Unintentional bias in the medical community – specifically the medical practitioner tendency to presume co-occurring physical and/or mental health issues are the result of Autism – is a well-known, long-standing issue in the Autism community. This presumption may occur inadequate medical and psychological training, inexperience of the physician, or even the communication challenges an Autistic person may encounter with contacting a doctor. Inequitable access to services often leads families to have to wait months to receive a diagnosis, and then sometimes years to receive services. A survey conducted by CMS showed that 60% of centers surveyed had over a 4-month waiting period, mostly due to workforce shortages (cms.gov). Additionally, the process of acquiring a diagnosis must be more affordable and accessible for Autistic people. Another important service that must become consistent across the country is Autism-specific training to law enforcement and first responders. Individuals diagnosed with Autism have unique communication and behavior that may cause those professionals to be suspicious of their behavior. It is known that about 20% of all Autistic people have an interaction with police by age 21; for the safety of Autistic people and those first responders, training is a necessity. A few states, such as West Virginia, have this training codified into legislation. Other states must, too.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>We need research into the impact of long COVID on this population as well as the general population. With increased anxiety of many Autistics, the fear of contracting COVID and fear of death of oneself and for loved ones has left an impact on people diagnosed with Autism. Anecdotally, Autistics have expressed significant trauma related to being isolated during the pandemic.</p>
<p>What lasting positive or negative impacts have societal changes due to</p>	<p>Anecdotally, numerous individuals diagnosed with Autism have experienced mental health benefits by being able to work remotely, as well as access</p>

<p>the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>health care via a telehealth option. A significant negative impact would be the lack of social skills that young Autistic children were exposed to during the pandemic, and those children now struggle able to integrate into what we would consider a traditional school environment (i.e. lack of social distancing, hugging/handshakes, masks, etc.). Doing school from home allowed students diagnosed with Autism to learn in a more comfortable environment, and many students are struggling with the transition back to more in-person scheduling. More Autistic students and parents are continuing homeschooling, despite schools going back to in-person.</p>
--	--

Name	Keyunna Harris, Caregiver
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory and motor-challenges when the autistic individual is non-speaking and do not have the motor strength to work with a standard AAC device. Gastrointestinal disorders due to limited diet and sensory challenges, but no means of communicating those problems.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	High support needs/non-speaking autistics, for sure my daughter, face challenges as soon as she wake up until she possibly finds sleep. When there are communication deficits along with developmental and learning disabilities, teachers give up on the child. A difference in brain functions immediately equals intellectual disability because of the lack of understanding or training on autism in the public school system. For example, most high support needs autistics will not be able to fill out this survey because of the broad questions and no clear modeling of the answer. High support needs autistics with other conditions will still most likely not be heard.
What additional research is needed to help address co-occurring conditions for autistic people?	Patterns in learning for non-speaking high-support needs autistics. Research on how to teach and empower high support needs autistics to hold meaningful and influential careers. In addition, research on medical deficits and biomedical research on the cause and ways to alleviate some of the debilitating autism symptoms.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Accessibility of services and government funding for therapies and family care help.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	

in-person social interactions and obligations)	
--	--

Name	Khalila
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Low energy, orthostatic intolerance
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Trauma caused by lack of childhood treatment or autism-based abuse/neglect.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Research on ADHD-autism connection, and autism-EDS-POTS-MCAS connections.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More providers for autistic adults, providers trained in autistic communications, less chances for one provider to prevent care.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	COVID-19 infections can cause worsening of physical conditions such as POTS, common in autistic people.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Emotional distress over gap between current data and public attitude.

Name	Kia Green, Emerge, Inc.
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As a provider of services of some individuals with Autism who are also nonverbal, the most significant challenge is understanding when they are in pain and where the pain is. We are often unaware that someone is in distress until its really bad or too late. It is very frustrating and upsetting for the individual, their families, and loved ones. Many individuals have not received proper medical care from healthcare professionals who understand where and what to look for. .
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Medication side effects and desired effects in individuals with Autism are not the common effects. Person's with Autism are often outliers from what is considered the medical norm. Many of the symptoms of the co-occurring mental health conditions simply result in aggression as a result of the person's inability to communicate. Even in persons with Autism having language skills, it is often not the appropriate language which can be extremely frustrating and also dangerous.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For persons with Autism and disabilities, stigma is still an issue. Housing for those who are in services and/or living with families, is still not comparable to society. Services are hard to acquire for those who were not identified in the school system as potential recipients of support. Services are almost non-existent in rural areas, in more populated areas staffing and support is a major challenge.
What additional research is needed to help address co-occurring conditions for autistic people?	More research regarding the GI sensitivities of those with Autism may help with understanding a lot about other co-occurring conditions.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autism Awareness, Autism is a spectrum of disorders. Most people hear and see information about Autism but there are so many horror stories, old wives tales, and falsehoods surrounding Autism. The promotion of truth backed by evidence based research should be shared everywhere, in schools, in the workplace, on the news.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Many individuals in my care with Autism regressed. It have been very hard for them to return to life as it once was. Many preferred activities no longer exist. Many individuals just cant bring themselves to leaving the home. Many others have developed a change in compulsion and or obsessions.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Access to more of the world virtually has been a positive impact.

Name	Kris Guin, Queerability
Demographic	Autistic individual; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As an Autistic person recently diagnosed with Type 2 Diabetes, I have found most forms of treatment for diabetes inaccessible to me.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Diabetes treatments often involve taking medications that require certain timing which is challenging for Autistic people who have executive dysfunction. Diet is also a way that diabetes can be managed, but many Autistic people have certain sensory sensitivities to different kinds of foods.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	More research is needed into how to treat diabetes in Autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More training for medical professionals in autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Kristen Brake
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory motor coordination
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Attention deficit disorder
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication and speech delay, learning disabilities, developmental disabilities, and intellectual disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	Teachers need to study/acquire specialties in order to teach our students. For example: Wilson reading certifications, learn how to teach math to kids with dev delays and autism.../ education needs to be researched.... No one knows how to teach our kids. They just want to put them in self contained classrooms and teach them life skills which they can learn at home. They should be going to school to learn how to read write and add and subtract.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	General family practitioners need to learn about autism and how to interact with people with autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The [profanity redacted] downs that occurred with the pandemic have been catastrophic for individual with autism. Telehealth is a joke and does not work with most children on the spectrum. Long wait lists have been made even longer since Covid pandemic.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased use in telehealth is basically equal to no treatments or therapies. Prolonged remote school has completely negated learning for someone with learning disabilities and is way farther behind than she would be. Societal changes include lost time of in person interactions... making friends and experiencing social gatherings and learning how to interact with people in general.

Name	Kristin Botwinick
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Binge-eating/obesity
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Binge-eating, excessive eating
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Interested in interventions to assist in weight loss/excessive eating. Traditional interventions e.g. CBT, hypnosis, psychotherapy seem to elude my son due to his executive functioning issues and intellectual disability
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Simpler process to explain and facilitate enrollment in various programs eg insurance and self-direction. Fund initiatives that truly increase the wages of support staff and thereby improve the quality of workers
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Some young adults were left with nothing as far as programming, supports and services for years as there was a drastic slow down in processing applications
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Given the extreme delays in processing applications for supports and services, along with the shutdown of community based programs, young adults on the spectrum were left even more isolated and in turn more depressed

Name	Kristin H.
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances - difficulty falling to sleep and frequently waking up in the middle of the night.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	OCD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Finding the right educational resources to teach a non-verbal child how to read etc. more over, the right resources to test how to know what the person is cognitively capable of. For example, I know that my nonverbal autistic child is able to read as he can independently point to sight words, consistently even though he was never taught to read . I would love to find an educational program that allows him to further his literacy skills and also test his literacy skills so that I might know exactly where he is academically. Most of the assessments and curriculums out there require a verbal component.
What additional research is needed to help address co-occurring conditions for autistic people?	More research into the G.I. system, and its effects on autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Covid took my then five-year-old out of a school environment and prevented him from having the education he needed at such a formative age. In addition, he regressed in terms of toileting, and went from almost 100% potty trained to not potty trained anymore At eight years old.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Academics were completely stopped for a period. My son was unable to attend school. He was unable to learn via telehealth models that were tried therefore, they disruption and services increased remote schooling an increased use of telehealth all affected him significantly

Name	Kristina Funk
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Pain not addressed or believed. Sleep disorder from childhood to late adult either never addressed or treated then medication removed. Various gastrointestinal problems. Hyper-mobility in joints becoming more disabling with age. Postural orthostatic tachycardia syndrome not addressed or treated.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression and anxiety that could be addressed with proper education for providers AND patients. Psychologists and psychiatrists who are not specialists cause distress in patients with inappropriate care.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication, whether lack of speech or gifted talent overlooked.
What additional research is needed to help address co-occurring conditions for autistic people?	How to support families and providers with education.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	The APA and AMA have acted to reduce specialists (for example, behavioral analysis) from the health insurance marketplace. Education professionals are not supported financially, and schools in the USA use up the lifetime insurance caps for individuals before they are out of elementary age.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Hypermobility joint damage and cardiovascular health
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Being able to work at home

Name	Kristina Tober, parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	sleep disturbances, dysregulation (both physical and emotional) that is unpredictable and can turn into dangerous behaviors (both self-injurious, to others, property damage) within seconds, seizures
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, aggressive and self-injurious behaviors, loud outbursts in public, inappropriate sexual behavior (disrobing in public), elopement and complete lack of safety awareness, manic behaviors
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	inability to communicate, intellectual and developmental disabilities, behaviors that arise out of an inability to effectively communicate needs/wants
What additional research is needed to help address co-occurring conditions for autistic people?	We need to understand how the lack of acknowledgement around profound autism and deference for neurodiversity is impacting families, funding and supports for these individuals
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to high quality care, continuing behavioral supports into adulthood, safe residential placement where these individuals can still have access to the community, interact with peers, live meaningful lives, job training, FUNDING!!!!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The isolation and complete lack of services during the pandemic had a far greater impact on this population than the virus itself.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	If you look at the impacts of social isolation and discontinuation of services during COVID on typically developing kids, multiply that by 10x. How do you explain to a profoundly autistic individual with ID/DD that they have to stay in your home, no more access to the activities they relied on for support, development. These individuals required 24/7 care -- and families were left bearing the total burden and stress of that during COVID.

Name	Kristoff Furgiuele-Weis
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances and sensory challenges. I've always had sleep issues since I was very little.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggressive self injuring behaviour, depression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Depression has gotten worse
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disrupted schedule changes

Name	Krystin LaBarge
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	ARFID has minimal resources available to navigate nutritional deficits. Parents and individuals should have safe and neuroaffirming guidance available to help expand dietary options that may alleviate gastrointestinal issues, increase immunity, assist with interoception challenges, and lead to a more satisfying and fulfilling life. Motor differences such as apraxia and dyspraxia are often overlooked yet highly impactful. It seems everyone is focused on behavior but lack the understanding of motor differences that can directly correlate to intense feelings of frustration and sensory overwhelm that motor challenges and their being misunderstood or unrecognized can lead to.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The challenges are many in a population of people who have been understudied and underrecognized are vast. AI Depression, anxiety and panic were co-occurring in my life and largely overshadowed my autistic traits and masking. These impacted my ability to obtain a traditional education, access higher education, or enter into a reasonable career despite being targeted for accelerated and gifted programs. Self injury is also very impactful and often a result of unmet needs of the autistic individual who is misunderstood. It can often be a coping mechanism gone awry while the individual is compensating for an outside source of stress.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning disabilities being under resourced or misunderstood can lead to depression, anxiety, lack of self confidence, and feelings of hopelessness. The category of learning disability should also expand to include the ways that not only dyslexia is misunderstood but hyperlexia as well. Hyperlexia being seen as entirely strength based can be problematic in children who commonly struggle with comprehension to match their strong decoding skills. Learning disabilities need to be found and resourced at earlier ages, and supported throughout their time of need. Communication disabilities need to be resourced- no individual should struggle to access any multimodal system of communication. AAC and sign language should be commonly taught, funded and resourced in classrooms and public spaces. Non speaking advocates need to be at the center of policy and education.
What additional research is needed to help address co-occurring conditions for autistic people?	The research to address co occurring conditions needs to include autistics who have been historically understudied and dismissed from the data- individuals raised as female, people of color, socioeconomically disadvantaged, and those in the LGBT+ community. We need access to adequate and accurate assessments, resources to assist in our day to day lives, readily available and educated medical personnel, neuroaffirming mental health guidance, accessible education, and employment.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance needs to resource far more than ABA, which many autistic individuals find harmful and abusive. Access to services- including assessments needs to be more timely. Wait times for an initial evaluation are commonly 18 months +. In my family's case the overall process took 7 years to arrive at a diagnosis for a child, gatekeeping precious resources and educational support in the process. Therapies to assist with apraxia and dyspraxia should be readily available, and would inadvertently assist with common dysregulation struggles as well.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I am of the belief that we are not yet fully aware of the extent COVID19 and has impacted co-occurring physical and mental health conditions, but I have experienced odd health occurrences after having COVID myself, and have many family members who fall into the autistic realm. We have very little data on the experience of perimenopause for autistic individuals, so it is also

	<p>hard to differentiate that with post COVID or Long Covid possibilities. But symptoms pertaining to commonly co-occurring conditions like POTS have been far worse after COVID- more feeling faint, light headed. Very easily fatigued even after extra rest. Brain fog. Autoimmune responses with no prior history before COVID illness. Gastrointestinal conditions worsened and I received a diagnosis of EPI, among other increased infections. My autistic child has had recurring headaches and migraines after his illness. We all continue to struggle to fight viral infections with immunity theft. And all have far mentally weaker health than prior to COVID. Currently I struggle to leave my house and have anxiety attacks often.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>In my experience the changes brought about by the pandemic are the realization that we can be so accommodating for individuals who have social differences and challenges, offering zoom connections and digital schooling (which was a highlight for my autistic child who no longer had expectations held over him related to eye contact, fidgeting, or doodling), but then increasingly rolling those options for digital interactions back with an attempt to “return to normalcy”. It reverses everything the pandemic showcased about disparity for social demands autistics face. I do think a positive that came out of it are the agencies that have offered more flexible, at home career options. And some are understanding of the increased need for sick and personal time.</p>

Name	Kyla
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	PDA
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA ADHD PTSD Complex PTSD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The continued stigma that autism is an intellectual disability
What additional research is needed to help address co-occurring conditions for autistic people?	PDA research
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easier access to supports- fewer barriers
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It has compounded significantly
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	That virtual services are possible - this needs to be an automatic accommodation permanently offered

Name	Kylie
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory motor and gastrointestinal issues
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety Aggression
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Learning, developmental, Intellectual, sensory overload
What additional research is needed to help address co-occurring conditions for autistic people?	More research needs to go in to the different profiles of autism so they can be more understood by the people around them. For example teachers and support staff.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to support services and accessibility to services in all areas. In rural areas there is not enough support.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Socialisation is much harder due to Covid 19 and being locked up all that time.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Definitely disruption in services and societal changes. Anxiety has increased as a result of not being able to go to school. Covid really had a set back for us as socialisation was already hard and it has exacerbated greatly since lockdown.

Name	Kym Pettitt
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	For my son, it is: Type 1 diabetes Celiac Disease
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Developmental disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	How to improve medical care
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Patient provider interaction
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	L. Void
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Gastrointestinal Disorders- IBS-D (Stress is a major trigger. Every day I go to work, I get sick to my stomach) Gerd Episodes of pancreatitis Sludge reported in gallbladder Other- Insomnia Deviated septum Impacted wisdom teeth Severe allergies
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have a 'good' salaried job, but my mental health is a disaster. Waking up- I'm always filled with dread and never well rested. I'm filled with fear on public transit, battling panic attacks and the urge to cry. My office stress causes severe physical illness, and I'm forced to work through it, fearing job loss. I suffer from PTSD, enduring & hiding my flashbacks throughout the day. Taking FMLA would mean a financial nightmare, and I fear resentment & retaliation for taking time off. At home, I'm crushed by depression, unable to handle basic tasks. This job is killing me, but I can't quit due to the need for health insurance. Alternatives like COBRA or disability are out of reach. The American worker's condition, especially for the disabled, is a cruel joke. I can only hope for an early grave.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I've lost months of memories this year recovering from ptsd. My short term memory was also massively impacted early on after the trauma. I needed direction from my employer in writing but my boss didn't understand. He just kept getting mad that I couldn't remember things he rattled off in passing the day before. I tried to explain that I was having flashbacks and crying spells, sometimes derailing myself from work for up to three hours at a time. He chose to believe that I've just become disillusioned with the job and I'm quiet quitting when I disappear during these episodes. No one gives a [profanity redacted] what I'm going through until I file the paperwork for accommodations. And as soon as that happens- I will be the bad guy. Sure, they'll comply. But they'll also be more critical of my work in other areas or maybe I'll be the next one laid off, failing to meet some new metric they've manufactured. No one cares about us. Everyone thinks their own battle is just as hard, so why should autists get special treatment and accommodations?
What additional research is needed to help address co-occurring conditions for autistic people?	-What's the deal with autism & connective tissue disorders -Why is it so hard to get special assistance? If I'm disabled to the point that I can't clean, health insurance could subsidize a weekly house keeping service. Insurance could cover quality of life items like noise canceling headphones, weighted blankets, sensor deprivation tank sessions. -Why is it so hard to get diagnosed with autism as an adult?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Access to healthcare needs to be free and easily accessible over telehealth. People who mental disabilities don't always have the capability to plan ahead for appointments.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I was doing pretty okay health wise. Then I caught covid twice in one year. After the second round, I caught strep throat 9 times and had a hospitalization for a UTI. I think covid severely damaged my immune system.

<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I felt safer on the roads with less drivers. Working remotely was amazing and the only way I want to work. Access to telehealth services increased and helped me see more doctors & therapists on a more proactive basis.</p>
---	--

Name	Laura
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Misdiagnosis
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Not being listened to or taken seriously
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Increase autistic persons autonomy. Lower cost and increase accessibility of services.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Laura
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	The most significant challenge faced by autistic people, in terms of mental health, is trauma -- whether we're calling it PTSD or its diagnostically nascent cousin, C-PTSD. Every autistic people I know experiences small and large injuries from being a mismatch with mainstream society. We know almost nothing about what it is to be autistic without trauma, because trauma is almost bound to happen to autistic people.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Autistic people need continued research into psychedelic-assisted therapies for trauma. As new modalities such as MDMA come online, autistic people need to be included in the first wave of patients. Trauma drives our suicidality the same way it drives the suicidality of combat veterans. It's the same, and it deserves and needs the same focus of treatment.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autism should be covered by insurance at parity with other conditions when it comes to psychoanalysis and its related forms (NOT ABA). Avoiding and processing trauma are essential to autistic thriving.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Laura
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Celiac, leaky gut, EDS, autoimmune diseases, anxiety, depression, hyper mobility, fibromyalgia, chronic pain, GERD, insomnia, SPD, dyspraxia, ADHD, OCD, PDA
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression, anxiety, ADHD, aggressive or self-injurious behavior, suicidal ideation
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Both my son and I struggle with learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities. It is difficult for me to hold down a job, and I doubt my son will ever be able to have a job.
What additional research is needed to help address co-occurring conditions for autistic people?	There is currently almost zero support for parents of autistic kids with high support needs. We struggle to maintain a job while handling insanely high stress at home due to our high support needs autistic son. We can't afford or even find adequate childcare for our autistic son. I am forced to stay home to care for him and my home is essentially a prison because I can't go anywhere or do anything due to my son's challenges. It is deeply depressing and miserable
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	As a late dx autistic person myself, I still have zero support from the government. Most autistic support ends at 18 which is a joke. Like we ever outgrow autism? We don't. It is highly difficult to maintain a full time job due to zero accommodations in the workplace. It shouldn't be so difficult to get on disability. I can't even get insurance currently. I can't afford adequate childcare for my autistic son. I need a qualified person to accompany us on public outings to help keep my son from eloping. The only thing covered is ABA and that isn't a good fit. Parents of autistic kids desperately need more respite care on a weekly basis.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I am autistic. I have permanent Covid anosmia taste and smell distortion, as well as long Covid. I can barely function. I am weak and exhausted all the time. I never recovered after Covid. Yet I have to stay home and care for my 2 kids full time and I am suffering horribly
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	One of the best things to come out of Covid was curbside grocery pickup and grocery delivery. I wish more virtual health services were still offered. I shouldn't have to physically go into a doctor's office to get an antibiotic.

in-person social interactions and obligations)	
--	--

Name	Laura Cosgriff, Lakewood
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disturbances, sensory integration, balance issues, and executive functioning.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, executive functioning deficits
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Communication disabilities, expressive language disorder, difficulties following multi-step instructions
What additional research is needed to help address co-occurring conditions for autistic people?	I would say more services and supports are needed in the areas of occupational therapy, speech therapy, physical therapy, and executive functioning in all these areas. OT and speech are the areas that have been the most successful for my child. Not sure if more research is needed. If you ask any parent, the needs are pretty well understood. The problem is only certain services are supported by insurance or by public agencies. If more research is needed to provide services to families and children, then those areas are the areas that are needed.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage of speech services and occupational therapy services. Equitable access to and accessibility of the services. Improvement in school IEP processes. My son wasn't identified until he was 15 years old because school staff never told me how to request services/evaluation from the school. I had to learn about it from people outside the district. I received strange feedback on and off for several years. I couldn't make sense of it and would talk to my son about it. Most of it I didn't understand as medical. These vulnerable kids and their families are dependent on the feedback from school staff. My son suffered unnecessarily for several years. This could have been prevented if one staff member could have simply said, "your son needs to be assessed for x, y, and z. This is who and how you need to ask for it."
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	It's made everything more challenging.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services,	The process for finding appropriate help is difficult anyway. But, COVID made it that much harder. For my son, in-person meetings/appointments are the most effective.

increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Laura Graham Holmes, Silberman School of Social Work, CUNY Hunter College
Demographic	Service provider, health provider, or educator; Researcher
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	When people experience physical health challenges, it is difficult to function at school, at work, at home, in relationships, as parents, and as community members. Suffering related to physical health conditions and difficulties fulfilling our valued social roles can then affect our mental health. In our field, we have often focused on academics, employment, and independent living, without the foundations of freedom from pain and physical suffering coming first, and I hope we put more focus into helping autistic people identify, manage, and cope with physical health conditions in the future.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I would like to highlight a particular condition that has been underaddressed: substance use disorder. Autistic people use substances for some of the same reasons that others do: for social lubrication, to overcome social anxiety, and to cope with physical and emotional pain. There is some evidence that those who use substances may be more likely than non-autistic substance users to develop substance use disorders. In my work with autistic people looking to gain more control over their substance use, I've learned that treatment for substance use disorder is even more difficult to access for people who are autistic, and particularly for those who rely on Medicaid. Substance use disorders are inextricable from issues of physical health, mental health, and everyday functioning and quality of life. We need more research investment to address substance use disorders among autistic adults and to treat them among autistic people who use substances.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Although there is a lively online discourse about autism and chronic pain conditions, the research literature on pain, pain conditions, and autism is in its infancy. However, there is some evidence that chronic pain conditions are more prevalent among autistic people who hold other marginalized identities (e.g., women, gender diverse people, and those who are gay, lesbian, bisexual, or queer). Basic qualitative and quantitative research is needed to understand the prevalence, mechanisms, healthcare experiences, and potential interventions for chronic pain management among autistic people.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Autistic people are being seen across specialists, whether or not they have an autism diagnosis. The ways in which people move through the healthcare system to receive screening and diagnosis for autism and common co-occurring conditions or needs (e.g., sleep disorders, GI issues, eating disorders, anxiety, gender-affirming care) is of great interest. Education and case management services targeting specialists could help more autistic adults be diagnosed, and a robust screening and referral service among autism diagnostic clinics could help more autistic people be connected with other services. Focus on training and supporting people who can provide adult autism diagnosis could also increase healthcare equity. For example, there is a huge labor force of social workers who speak languages other than English who could be trained to provide diagnostic services, but many of them are unaware of that fact and unable to pay for additional training; how can we provide scholarships and support for them?

What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	For the issues I am most interested in - chronic pain or other physical health conditions, substance use disorders, health disparities related to being LGBTQIA+ - there has not been research on the effects of the COVID-19 pandemic, but it is potentially relevant for all of these.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Laura Mansdorf, Mother of an Autistic Child
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My daughter has had casts, braces on her legs and botox to try and reduce the likelihood for surgery on her heel cords in the future. Her idiopathic toe walking and mixed muscle tone leads to unsteadiness, which results in falls. She has been diagnosed with insomnia. Her sleep issues make it difficult for her some days to attend to tasks and to learn. Her sensory issues and anxiety over food have required her to continuously work with therapists so that she doesn't backslide into only eating 3-4 things. She's made an incredible amount of progress, and it takes a lot of continual effort to maintain it.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My daughter has a limited ability to express herself using speech. She is verbal to an extent, with a handful of functional phrases. But you wouldn't be able to get her to elaborate past "I'm sad" as to whether she is hurt physically, emotionally etc... This inability to quickly express herself leads to frustration, aggression and self-injurious behaviors. She has a behavioral team of people in place at home and at school which have written behavior intervention plans to help reduce these behaviors. In addition she is also diagnosed with ADHD as a comorbidity. It makes it difficult for her to attend/focus on tasks she does not find interesting. Often times, people will discount her ability because of the behaviors surrounding her ADHD.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Often times, issues arise when my daughter cannot communicate verbally or using her AAC. Generally, when she cries spontaneously without a clear reason, she is unable to articulate complex thoughts. It is a challenge to be able to aide in her care. In regards to her school work, she is able to complete tasks with extra time, repeated refocus and an individualized approach to her learning. Standardized learning does not get through to her-- being able to teach her 1:1 has been the most successful way to help her gain skill. Teaching the basic skills in order to learn have helped her understand how to read, retain the story, and math skills. Spending time teaching her life skills has helped expand her view of the world. The goal is to teach her everything necessary to be as independant as possible.
What additional research is needed to help address co-occurring conditions for autistic people?	I think there needs to be research done to see how to reduce the amount of distraction in the mind of a person with autism and adhd. How medicines metabolize in an autistic person's system vs. a neurotypical person. More in depth research into what causes the sensory overload, how the brain reacts, and how to reduce the issues associated with overwhelm. Also research on how to best educate those who have the most support needs. I am a firm believer in "support needs" over "function." Had I just left my daughter without the most support possible, she'd be functioning at a much lower capacity than she is now. How do we bring the highest quality therapy to the most children possible? How do we ensure that its being done correctly?
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	It should not be a fight to attempt to receive services and assistance. The process taking so long, with so much paperwork that as a single parent, frankly I'm burnt out. There should be a easily attained standard level of care for all autistic people who require support. High quality ABA with focus on skill acquisition. Insurance has been a constant battle-- they deny our providers payment because my daughter also has Medicaid for Disability, so her primary insurance claims that Medicaid is the primary when it isn't. In regards to patient-provider services, I really just wish that medical doctors, police officers, EMS... would be better educated on how to compassionately and empathically assist autistic people. We've had an ENT want to hold my daughter down to do an endoscopy without anesthesia. In the ER in 2019, I

	<p>had a doctor be persistently rude when my daughter wouldn't give a urine sample or answer questions. She had the flu and a fever. I'll never forget the frustration and disgust on his face. In public school the school psychologist, when asked to give a Functional Behavioral Assessment, stated that "the function of her behavior is Autism" which is incorrect. The teachers keep her at the same level of studies for a year because they did not understand she knew the material they were teaching. I read stories of countless people tased and shot by police because they did not immediately comply. Since my daughter may elope, I constantly fear this may happen to her.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>We've had to reduce the amount of social interaction we participate in as a result of attempting to avoid COVID-19. There are times where staff is not available due to an outbreak.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>As said previously, we attempt to be as diligent as possible to avoid infection, because it is much more difficult to care for someone who is unable to articulate what is wrong. It causes us to reduce the amount of time in the community, and we are able to work on social goals less often as a result. My daughter cannot do her ABA therapy over the computer, so there is an increased risk of infection by allowing multiple therapists into our home.</p>

Name	Laura Mewbourn
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I think for both my son and I, our most significant physical challenges are related to sensory difficulties in the public sphere. This is one of the least understood yet aspects of being neurodiverse and can be frightening both for the person on the verge of meltdown as well as a stranger witnessing said meltdown. I would order groceries and have them delivered, but I cannot afford the extra costs associated with delivery fees, tips, etc.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My most significant mental health challenges stem largely from a lifelong, mostly untreated, anxiety disorder which I believe was born in part from a childhood of unrecognized autism and adhd. As an adult, I realized that all of my thoughts and feelings were not healthy and that there were resources available to get that anxiety under control. Unfortunately, as a low income person, I cannot currently afford my adhd medication or the in-person psychotherapy that I badly need at this moment. As a result, I also grapple with clinical depression and occasional bouts of suicidal ideation. I have struggled to find providers who are knowledgeable about psych med management or have had providers who treat me like a drug offender for wanting my prescriptions refilled. I left one such provider and gave up on treating my adhd after repeated conflicts over prescription refills. I struggle sometimes with daily tasks as simple as phone calls because I absolutely cannot have a verbal conversation in that moment. To explain it to an outsider sounds like whiny blame-shifting, so rather than explaining, I often withdraw into further isolation. In short, I think the biggest challenge are the compounding factors of living life as a neurodiverse adult. One thing piles on another, leading to being virtually incapacitated with no outside support (or inside support, since I'm a single mother).
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Diagnosis and support in the academic setting. My son and I are twice exceptional. I did fairly well in school, enough that any perceived gaps in my academics were considered a lack of effort rather than a lack of ability. My son's experience (he is 7) has been a little different only because I am hypervigilant. His school has actually declined testing (OT) because they decided he didn't need it, and yet we consistently receive feedback that WE need to work on his writing/fine motor skills. Because he is at least average in all markers, they have decided he does not need additional support services. I suspect he has other learning related challenges, but as long as he is doing okay unsupported, our only choice would be to pay out of pocket for further evaluations. I find the rigidity of school extremely difficult.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	There is a pervasive idea that autistic children grow up into fully functioning adults. While that's clearly not the case, support services for "high functioning" neurodiverse adults are minimal. I would LOVE to seek assistance with executive functioning. I would love a competent psychiatrist that doesn't cost me \$175 for every visit and meds that aren't \$300/mo. I would love therapy to help me process my day to day life. I find connecting with other neurodiverse adults to be INCREDIBLY helpful, and while I have a resource available for that, I know many people do not. I think society has convinced itself the problem does not exist when the "problems" have actually just isolated themselves to a degree that they are no longer noticed.

What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Laura Saenz
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Hypermobility and connective tissue disorders like hEDS contributing to gastro, sleep, POTS, MCAS, PMDD, endometriosis, poor healing of wounds, hernias, migraines due to cranial cervical instability and chiari malformation. But #1 is the medical gaslighting telling us it's just anxiety then prescribing meds that don't work for our neuro type.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is the direct result of undiagnosed and "pushing through" all our issues. Burn out is waiting for all of us. I'm in year 3 of burnout at 55. The medical gaslighting and medical ignorance is causing us to leave the medical system entirely to self medicate. I bet more than half of homeless are neurodivergent.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	ABA is the only "treatment" in the school setting and its straight up abusive. It does not help with any learning disabilities. Most of us figure out our own "systems" for our disabilities bc of the unintended abuse within the education system. After figuring that out, later in life the physical symptoms flare up worse. Usually during pregnancy and menopause.
What additional research is needed to help address co-occurring conditions for autistic people?	The most detailed research right now is on Tik Tok. Yes, I read medical journals and desk references. But only Kimberly102347 has mapped out the co-morbidities and the triggers and deficits we need tested regularly by MDs. Her research answers all of these questions. And we need to get folate out of our food supply.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	#1 Eliminate ABA #2 put autistic people in charge #3 test all neurodivergent people for connective tissue disorders #4 test all hyper mobile people for neurodivergence #5 Create new specialty of connective tissue disorders so one MD can know about entire patient instead of subbing out to 10 other specialists. Which leaves us running our own healthcare. #6 re-educate entire medical system on what neurodivergence actually is so they stop infantilizing us and thinking we are not smart.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I'm autistic. I recognize patterns. I know covid never left. I am vaccinated and wear a mask. Although living in one of the largest metro areas in the country, and traveling internationally, I have not gotten COVID.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Remote school should be an ongoing option for all. When someone doesn't feel well, they can do on line school. It would be helpful when my autistic daughter is dysregulated. Sending her to "power through" at school is just cruel. She's in emotional and even physical pain.

Name	Laura Stoddart
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My PDA son's ability to access basic needs of sleep, eating, toileting and hygiene practices due to the accumulation of stress bought on by his nervous system threat response means that his disability requires increased amounts of care giving support.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA being a nervous system disability means regular activation of the threat response which can result in explosive autonomic flight or fight behaviour beyond his control which impacts his relationships with peers and adults and his own mental health in terms of self loathing and low self esteem.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Getting others to recognise and acknowledge PDA in the DSM-V so that it is taken seriously by professionals and not responded to through a behaviour modification lens as this exacerbates the child's responses leading to burn out and trauma. Nervous system activation needs to be viewed as beyond the child's control with the understanding that adults need to modify their practices to accommodate the child if the child is to successfully engage.
What additional research is needed to help address co-occurring conditions for autistic people?	PDA recognised in the DSM-V as a nervous system disability that is not under the control of the child. That the cumulative nature of stored stress has a debilitating impact on the child's ability to access both basic and secondary needs which is beyond their control. Activation of the threat response needs to be viewed as a panic attack not a behavioural choice that can be conditioned. ABA therapy is highly damaging to the PDA child.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Care giving support in the home when cumulative stress activation impacts basic needs. Financial aid for parents who have to leave work to care for children in burn out or who cannot access education outside of the home. Raising the profile of PDA so that parents are taken seriously, believed and supported rather than being gaslit, isolated and shamed in society.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Access to services delay and increasing wait times for professional assessments etc putting more pressure on families supporting children in the home.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Access to support being delayed.

Name	Laura thimen, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Physical aggression to others s the worst in profound autism, inividualized care is important,. My son bites, kicks, push us.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression, and ocd. Impulsivity with adhd is the worst. He can be super aggressive
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	Medicines to reduce aggression, stomach issues,
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Proper care of behaviors, insurance, respite for parents it is 24 hours challenge, dangerous, more impatient behaviors unite, more group homes, better schools.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My son aggression is worst, after the pandemic he is not able to be with others kids.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Lack of services during the pandemic, for servers cases online school don't work,

Name	Lauren
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I've had lifelong GI issues, disordered sleep, dander and pollen allergies, and migraines. The latter two get worse in periods of stress and often coincide with times when I feel overwhelmed. Eating can be difficult for me as well, which has worsened the GI issues. With the exception of the allergies, my autistic partner experiences all of these to a greater extent; she also has more sensory and motor challenges, which all impact her day-to-day life. Overall, I think that these all contribute to stress and anxiety; for example, when eating and food are already hard, GI issues make them even more of an ordeal. Problems with food, problems with sleep, poor self-care, and the stress caused by all of these compounding with each other, can lead to a general increased risk of additional physical health issues.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression contribute to general difficulties around switching and executive functioning, to the point where basic ADLs can become an ordeal. Anxiety additionally compounds social difficulties that already exist around general communication, reading others' signals and expressions, initiating and sustaining conversation, and interacting in group settings. Co-occurring OCD has worsened my internal distress over breaking internalized rules and routines. My autistic partner's mental health is also significantly impacted by PTSD and dissociation, and the intersection between her ASD, PTSD, and OCD has led to significant daily life difficulties.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Autistic individuals with ID/LI are a vulnerable population who are at increased risk of victimization, but there are considerable barriers to their inclusion in research and in autistic self-advocacy. They also require a level of support that is stigmatized even within the autistic community, especially among those with lower support needs. Additionally, in my personal experience, ADHD compounds with ASD and makes task switching and executive functioning more difficult. Basic ADLs, like eating, brushing your teeth, or taking a shower, can become enormous tasks that are all the worse for their regularity.
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more research that focuses on autistic adults, since a lot of autism research tends to focus on children or on potential causes of autism. I think that research that looks at autism alongside mental health conditions such as OCD or PTSD would be hugely beneficial, along with research that goes beyond prevalence or causality and has a more long-term scope, such as managing chronic co-occurring physical health conditions or improving general quality of life for autistic adults across all levels.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Even among professionals such as occupational therapists, there is still a lot of stigma around adults needing high levels of support, and they are often unprepared for addressing autism-specific issues, such as RRBs or cognitive rigidity, in adults in a manner that is compassionate and respectful. Professionals also need to be able to recognize and address the impact of trauma on autistic individuals. In addition, doctors and mental health professionals need to be prepared to communicate with patients with ID/LI, and to engage with them in a way that doesn't further isolate or belittle them. In the background of all of this, there are still fundamental practical barriers to accessing autism services, such as questions of transportation and money, and difficulty even finding professionals who are willing and qualified to work with autistic individuals.
What lasting impact has COVID-19 infection and illness had on co-	On the side of physical health, COVID-19 infection led to GI issues and constipation that lasted long past the initial infection itself. On the side of mental health, the pandemic has worsened my anxiety and depression. It

<p>occurring physical and/or mental health conditions for autistic people?</p>	<p>worsened my previously uncontextualized OCD symptoms to the point where they had to be addressed. It has made socializing and public gatherings even more difficult both because of the added fear of infection or infecting others, and because in-person classes, work meetings, and social events seem more intensive and tiring after I became acclimated to remote options.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The increased use of telehealth services and normalization of remote work and school options have had a positive impact, along with the reduction of in-person social events. In an academic context, recorded lectures, flexibility with attendance, and increased teacher empathy for absences and accommodations also represent positive change. However, I believe that an uneven and unspoken, but still insidious pressure to transition back to “regular” life, despite the realities of the pandemic still persisting, creates a lot of negative stress even with the increased accessibility options brought about by remote work and school.</p>

Name	Lauren
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Fibromyalgia, sleep disturbance, AFRID, eczema, ehlers danlos
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Alexithymia, social anxiety, depression, adhd
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Specific learning disorder, below average working memory, gestalt processing, auditory processing difficulties
What additional research is needed to help address co-occurring conditions for autistic people?	Research based on autistic people's experiences. Most research is based off caregiver observations, so they aren't inclusive of how the autistic person feels or experiences the world (aka ABA is harmful to autistic people, but caregivers love it). Understanding autistic communication styles.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Improving awareness of autistic needs or communication styles. I have been fired or ostracized for my assertive communication and it's so frustrating. Help teachers and employers create affirming spaces.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Decompensated overall physical health due to inflammation from covid. Increased fibro flares. Chronic tinnitus and laryngitis. Improved mental health being able to work remotely and no forced social encounters.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive - work remotely is great! Negative - video conferencing is so exhausting for autistic people

Name	Lauren Agoratus, SPAN/Family Voices NJ
Demographic	Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As far as physical conditions, the two most commonly cited are seizure disorder and gastrointestinal issues. In addition, health disparities and discrimination exist for people with developmental disabilities . We appreciate the NIH designation of people with disabilities as a population with health disparities. We participated and highly suggest IACC examine the Center for Dignity in Healthcare for People with Disabilities, now called Think Equitable, recommendations on prenatal, mental health, transplant, and end-of-life care. Finally, we would add the risk to children/youth with autism and other developmental disabilities having limited access to good oral health providers.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Regarding mental health, there is comorbidity between developmental disability and mental illness. In addition, dual diagnosis of DD/MI is difficult to find treatment for, especially in crisis. There is a shortage of specialists, hospital beds, and wait lists. This was well documented in the Family Crisis Handbook which we ask the IACC to look at with their recommendations.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	We also understand that there may be other comorbid conditions associated with autism such as LD, dyslexia, ADD/ADHD, etc. It is important for both educational and medical professionals to look at the necessity of additional interventions, although some developmental pediatricians may note there is nothing more that needs to be done medically based on if the child is already on medications etc.
What additional research is needed to help address co-occurring conditions for autistic people?	Research in autism continues to be essential due to increasing prevalence rates. We would suggest that more research be done on the comorbid conditions listed above. Note: Additional research should not take funds away from ensuring appropriate services and supports are available to people with autism and their families.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services and supports are essential regarding comorbid conditions and autism. As stated previously, a secondary diagnosis may necessitate additional educational or medical interventions. In addition, not all states have ABA certification requirements. Some ABA practitioners use forceful manual guidance, restraints, and other aversive techniques. As members of the NAMI (National Alliance on Mental Illness) national restraints committee, we found that aversive interventions are ineffective as behavioral modification and experienced as trauma. Indeed, the U.S. Department of Education noted that these techniques are not evidence based best practices . There are alternatives to ABA such as DIR (Developmental, Individual-differences, Relationship-based) model which is child-led, otherwise known as FloorTime. In addition, many students with autism could benefit from sensory integration (by a specially certified occupational therapist) and social skills which are related services under IDEA (Individuals with Disabilities Education Act), but school districts may not readily offer and families may be unaware that these helpful therapies are available in addition to the usual PT/OT/speech (physical, occupational, and speech therapy).
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	The effects of COVID were two-pronged for people with autism. Physically, they were more at risk of COVID complications . Additionally, in some states there were actually injuries or even deaths due to health disparities, including for people with developmental disabilities, as healthcare was inappropriately rationed. Also, COVID exacerbated mental health conditions;

	<p>some people who didn't have mental health issues do now, and some of those with pre-existing mental illness worsened. Many people with autism also had difficulty understanding the changes, hygiene, and social distancing associated with COVID, and some were unable to tolerate masking due to sensory issues. Long term effects of COVID (including Long COVID), both in terms of physical disparities and inequities as well as increased mental illness, remain.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>In general, we would also highly recommend referencing "Educating Children with Autism" which has clinically researched interventions for effectiveness. We also highly recommend the NIH National Center for Complementary and Integrative Health as the NIH found almost 81% of families of children with autism used alternative medicine. We would also suggest consulting with the AAP (American Academy of Pediatrics) clinical guidelines and policy statements as they relate to autism. For example, AAP cites the dangerousness of chelation for autism, or that gluten/casein-free diets do not cure autism but may be helpful in identifying food allergies only.</p>

Name	Lauren Dehler
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	PDA (Pathological Demand Avoidance) is a subtype of Autism that much more research is needed to understand and better provide accommodation and services for.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Trauma, anxiety, co-occurring ADHD, suicidality for untreated trauma and lack of access to accommodation, needs, and understanding by loved ones and community.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Nervous system dysregulation caused by overstimulation, lack of accommodation, lack of resources, neuromormative assumptions of health and wellness.
What additional research is needed to help address co-occurring conditions for autistic people?	So much! Include Autistic people in designing research, focus on PDA, focus on intersectionality of those with marginalized identities, focus on including medium and high support needs folks in research, gender and racial bias in research and treatments, ableism in fields of psychiatry and psychology.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverages for services, trainings for practitioners in the neurodivergent affirming model, awareness and training on PDA type of autism, support for Autistic folks with multiple marginalized identities, integrating physical health care with mental health care for Autistic folks, training medical doctors about the many co-occurring health conditions that Autistic folks have.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Many, increased health issues with autoimmune conditions and physical health issues, emotional health issues of isolation, trauma, anxiety, increased ableism and ignoring of calls from those in the disability justice movement.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The pandemic has allowed many Autistic folks to work from home and be virtual that has increased accommodations for many folks. During the height of the pandemic, much of health care was also accessible virtually, though that has been decreased and causes serious set backs for folks with multiple mental and physical distress.

Name	Leah Bennett
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	It is a challenge as these co-conditions often exacerbate and trigger the health/mental co-condition(s) that my daughter has. An example is she struggles and has since birth with sleep disturbances . When her sleep is sporadic it interferes with her abilities to manage anxiety/depression , ADHD . When she has gastro intestinal issues , she can not longer eat and doesnt feel well, retreats socially and this triggers her anxiety and affects her sleep
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and depression make it incredibly difficult to be social and sociable . These in combination with ASD and ADHD make it incredibly challenging to have relationships with peers and or family
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The learning, developmental, intellectual and communications disabilities make motivation and goal setting incredibly difficult if not non existant . There is a huge struggle as my daughter ages to assist her to grow and be independant and enjoy her life and be responsible for her self
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	During the pandemic remote schooling had a very severe negative impact on my austistic daughter as the ciriculum changed and the online classes were unable to affectivly keep her interest . The lack of a support person and in person learning interaction also negativly affected her . Reduced in person social interactions and obligation are a lasting negative affect During the pandemic she did not have to interact with her peers , she did not have to keep a rigorous schedule (get ready , eat, breakfast , get on bus, arrive to school ontime) She has since graduated and I believe this has perpetuated the lack of social interactions and obligations

Name	Leah Goeres, Citizen
Demographic	Autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Collagen disorder - joints unstable and resulting chronic pain. Having to take weeks of disability off to rest hands, back, hips from seeming normal use. Postural Orthostatic Hypotension likely secondary to collagen disorder - unable to maintain adequate cerebral perfusion when standing. Fainting or "blacking-out" when changing from seated position to standing position.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression and Anxiety requiring two medications to treat. ADHD. Skin-picking disorder. Verbal outbursts.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Difficulty reading social cues
What additional research is needed to help address co-occurring conditions for autistic people?	Finding genetic markers for joint hypermobility. Understanding the pathogenesis of joint hypermobility and postural-orthostatic hypotension. Research describing the kind of supports hEDS people need to remain in the workforce. There is no specialty that "owns" hypermobility disorders in the same way the endocrinologists "own" diabetes or Rheumatologists own Rheumatic diseases. Research needs to be done around what training practitioners need to be able to treat and manage these conditions. Research describing the economic costs of untreated or under-managed hypermobility disorders and postural orthostatic tachycardia syndrome. Guidelines need to be developed for hypermobility disorders and dysautonomic disorders.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easier access (easier insurance coverage and HSA reimbursement) to compression garments and braces to help joint hypermobility disorders and POTS. Easier access to massage therapy (easier insurance coverage and easier HSA reimbursement) Early intervention on hypermobile children, initiating physical therapy and strength exercise programs early in life (screening in schools)
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I have no suffered a lasting impact of COVID-19 infection.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school,	Longer wait times to get medical care. The healthcare system is crumbling, it is harder to get healthcare needs met. I work in healthcare and the mass exodus of early retirees has led to an extremely stressful work environment. Loss of work-place culture as most meetings are remote/virtual.

increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Leanne Maidment
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sleep disorder has had the biggest impact on our family. Both I and my two autistic children have had problems with sleep and lack of sleep impacts so many other areas of life.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	My youngest child is autistic and we believe PDA although they don't diagnose that here. He also has ADHD and poor mental health, which has led to suicidal behaviours. I think ADHD and ASD conflict in so many ways that it can be absolute hell for a person when their own brain contradicts itself on a daily basis.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My children are verbal which means people expect them to be able to communicate, but they are unable to communicate feelings and other things.
What additional research is needed to help address co-occurring conditions for autistic people?	I believe PDA needs to be more widely recognised and diagnosed and research is needed into how this differs from "typical" ASD, how it presents, strategies etc. I also believe that although ADHD and ASD are understood as standalone conditions, more research is needed into what it means when they are co-occurring.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Leanne-Claire Civiletti
Demographic	Autistic individual; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I find that the most challenging aspect is the lack of education and experience in the medical profession of Ehlers Danlos Hypermobility and autism. I have always had sensory difficulties with sound and fabrics, light , the inability to hear and process information over the phone. I'm 67 years old, I was adopted at birth and I wasn't diagnosed with Autism until I was into my late 30s. I learned to mask my symptoms , since I have become profoundly sick with CFS-ME and have been with several unknown rare diseases. My psychiatrist has diagnosed me with delusional disorder thinking that I have diseases that most medical professionals have not had experience treating. My visits have all been over the phone, when I requested that my psychiatrist look up Ehlers Danlos syndrome she couldn't understand why that disease has anything to do with psychiatric disorders. Trying to educate individuals on the complexity of the inter connected relationship of systematic diseases.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Not being able to locate appropriate physicians who understand sensory overload and how this can trigger physical symptoms. I can't afford to pay out of pocket for specialists any longer. I'm on Medicare and SSI. I suffer from anxiety and fear of seeing a new provider to the point of refusing to go to the ER. I have Dysautonomia and when I stand up my heart rate goes sky high, legs swelling and compression to my spine. I cannot verbally answer rapid paced questions over and over and am refused using my communication IPAd. Dismissed with anxiety. Really frustrated when you're physicans does a EKG and tells you you have a heart attack. Emergency rooms need protocols enforced for people who have hEDS and Autism. I have no support system and my inability to communicate to medical professionals who know very little about the complications and symptoms of hEDS is baffling.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The inability to answer questions and explain symptoms. I expect to much and assume that my symptoms will be believed. I go into absolute panic at the idea of filling out. Medical intake only to be dismissed , lack of awareness. Invisible. Just because I can talk and respond does not mean that I don't need to use my communication assistive technology. I'm so tired of being told I'm doing fine when I'm not and speaking caused physical pain and anxiety as I can read what I'm saying or what's being asked of me. Then I'm labeled with a description which I would not have if my disability was accompanied as asked.
What additional research is needed to help address co-occurring conditions for autistic people?	Research ? I wish that more education and awareness was made to the medical community. Ehlers Danlos Syndrome and Autism isn't rare. I personally know over 18 people in my city that are diagnosed with both and are struggling to get appropriate medical care.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Medical care and insurance would be a start. I've tried to fill out the Calif rare genetic disease program paperwork. I can't do forms. I've never been able to do forms. I personally need more help with getting my medical records and history of my prior diagnostic records in one system of care. I need help is amending misdiagnosis and MIs interpretation of what I did not say but is quoted in medical records. Lack of understanding and communication with doctors and staff. The energy I have to communicate with individuals lasts about one hour. I'm in recovery from that hour for weeks. I replay the interaction over and over trying not to blame myself for being denied accommodations for my communication difficulties.

<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>Lack of support and care during the COVID pandemic. Isolation and masks and inability to see or “ read” the person examining me.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>I do like having zoom appointments with medical care. If I know the physician prior and there is a established relationship. Masks and disinfecting which triggers mast cell activation reactions. Challenge. I don't recognize medical professionals when they don't have a mask on. I can't communicate. I can't recognize the affect or response in a person who is wearing a mask that I don't know well.</p>

Name	Lee S.
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Honestly, the health effects of the items listed (stress created, lack of sleep and sudden, severe conditions that can occur in random situations), coupled with the challenges Autism already presents can make processing one's environment nearly impossible in both the short and long term.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Speaking only for myself, I would say depression is paramount, along with anxiety and aggressive behaviors brought on by frustration and confusion. It is safe to say that all of the mental health conditions listed above are going to be tremendously significant to a variety of people, some more than others based on their experiences.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	In my experience, each of these can take their turn as being the most significant depending on the situation at hand. Communication disabilities occur daily, whether recognized or not, but the developmental, learning and intellectual components may not even be know to the person who is dealing with them and each of those can create incredible challenges in ordinary situations.
What additional research is needed to help address co-occurring conditions for autistic people?	There is a wide gap between neurotypical and divergent individuals mostly because both of these conditions are life-long and are nearly impossible to comprehend without experiencing them yourself. Research would be useful in pinpointing the specifics that each of these types of people has in variance and developing simple mechanisms to mirror more easily sustainable traits.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above and, and I cannot write this in bold enough letters, SERVICES AND HELP FOR AUTISTICS ADULTS ACROSS THE SPECTRUM. Autism is not a condition that goes away, it is one that some of those who live with it have been able to cover up due to intellectual capacity to formulate behavior patterns in typical interactions with people around them.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Those were terrible times as the typical social structures, general scheduling patterns and behavioral processes that many of us studied for years to try and accommodate all changed overnight. This still continues to this day, since it has been noted that people are continuously recovering from the changes brought on by Covid, so to are many Autistic individuals who must now start from square one or risk negative impacts from their new inability to fit in.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I personally found the distance between people and the decrease in crowding very positive, however not having the opportunity to distance oneself from family, etc. was difficult. One thing that is a negative consequence is that, while Autistic people would have less contact and hence less need for altering their behaviors and dealing with difficult situations, we also move further out of the culture and so societal norms have changed. This means, when Autistic folks have to re-engage the public, they are now at a significant disadvantage of trying to figure things out as they go, even the older individuals with more experience.

Name	Leeann
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	There are many physical ailments that effect the autistic community ranging from gastro intestinal issues to ehlers danlos syndrome. I suffer with many and find that it is difficult to keep up with a regular 9-5 work week and keeping a consistent routine due to the inconsistencies that coincide with these ailments. Regular daily functions become almost impossible at times because these ailments also affect our mental well being and ability to form a healthier lifestyle
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Autistic Individuals find it difficult to advocate for themselves because of the constant misdiagnosis received by medical professionals. There is just not enough research or trustworthy resources specifically in regards to autistic women so we are misdiagnosed with BPD, bipolar disorder, as well as depression and anxiety. The root cause of those SYMPTOMS are not addressed due to being overlooked and we are often misguided.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be more research on autistic women and the differences associated between male and female autism. Autistic women are very often overlooked or misdiagnosed due to the similarities between previously thought "female mood disorders" such as BPD and bipolar disorder. In turn, we are misguided or medicated for an ailment we do not have.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I've found in my experience that many medical providers carry outdated or misinformed information in regards to autism. Regular revisions and information should be shared with family providers/primary care providers as they are discovered and/or questioned. This, I believe, will help the issue of patients being misdiagnosed and/or overlooked.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Leigh Powell, NCSA TN Chapter
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Bipolar and significant sensory challenges, in addition to autism and ID, cause my son to have severe behavioral challenges. There are no programs and services in ECF that are remotely appropriate for my sons needs. By their design, the day and supported living services in ECF will NOT be able to manage my son's behaviors. Sadly, they will cause him extreme mental anguish and duress that will escalate his dangerous behaviors over and over again. He needs supports designed for lifelong high behavior support needs. This does not currently exist.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	As per previous response, there are no appropriate day/supported living models in ECF to deal with lifelong high acuity behavioral individuals. Current models will provoke extreme stress and sensory overload for my son, severely escalating his behaviors. I cannot send him to camps or day programs for those with disabilities because they cannot manage his behaviors. He is isolated and he wants to be around others. It is also very difficult to find people to come into my home to help with him because they are scared of his behaviors.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	For those with autism and intellectual disabilities it is almost impossible to find psychiatric facilities/stabilization units that are equipped to help them. It is hard for people to learn what my son is saying even though he is verbal. The constant revolving door of staffing issues will ensure that much of the time the staff that will care for him will not be able to understand his communication.
What additional research is needed to help address co-occurring conditions for autistic people?	What I do know is that the bigger issue is that no one will step up to the table to address viable appropriate options for those with lifelong high acuity needs. When Tennessee's most fragile, vulnerable, and needy are ending up being warehoused for months or years in hospitals, mental institutions, out of state placements, or jail it is clear that different options are needed. Recently, Jordan Allen of DIDD said that solutions for the high acuity cases were "unsolvable." I don't believe that is true. Tennessee needs to involve the families of those with high acuity to help design appropriate housing and support systems for them.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Allowing Sheltered Workshops and Farmsteads/Alternative Housing models that are environmentally modified to support those with high acuity behavioral needs. That would not mean that they could not access the greater community when or as their behavior would allow, but it would ensure regular structure and social interactions for them in a much safer environment. There also needs to be options for 1 on 1 or 2 on 1 staff for those with high acuity needs. There needs to be specialized transportation options as well in order to keep driver and/or others safe.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	I stayed home with my son with no help for over a year and a half without going out in the community at all in fear that if I got Covid and died or were in the hospital there would be no one to care for my son. If I died and he was placed in ECF it would be so cruel for him as it would increase his aggression and he would end up hurting someone and in a very bad situation with no viable solution in sight. Literally torturing my son because there are no appropriate long term housing/supports specially designed for those with high behavioral acuity needs.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	It has further heightened the staffing crisis for DIDD/ECF Choices Waivers. The safety, stability, and security of those with disabilities is disrupted by lack of staff, untrained staff, and constantly revolving staff. Some families are

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	being told to come get their family members because there is no staff available to care for them.
--	---

Name	Lekeisha Williams
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	my son has a sensory delay, and also sleep disorder
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self injury
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Developmental
What additional research is needed to help address co-occurring conditions for autistic people?	Self harm
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I don't know
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Mentally
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Disruption in service

Name	Lesley
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy, sensory and motor challenges and anger
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression, aggressive behavior, suicidal, anxiety. Doesn't fit into this world.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	communication, learning, intellectual and developmental disabilities. I have twins...they are 15, one is like a 3 year old and one is like a 9 year old...with men bodies. Can hardly find any help
What additional research is needed to help address co-occurring conditions for autistic people?	More education for our schools...anything that has to do with autism needs to be highly researched. 1 and 30 something kids is an epidemic
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	We need help for when our kids age out of school programs. More insurance coverage, but mainly safe places for kids that are not high functioning. Any and all help will do!!
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Leslie
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Communicating clearly. Doctors like make up their own idea what I'm saying
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	No useful depression treatment. The pills make me sick
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I'm fortunate in that I am verbal. Others are not so.
What additional research is needed to help address co-occurring conditions for autistic people?	People that are nonjudgmental, fair treatment.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Now it is psychologically difficult to go to places .
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Leslie Lussier, Parent and Guardian
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy is the most severe challenge for us bc my son has been hospitalized 3 times for uncontrollable seizures. He's on 3 medications now to prevent them but we are worried about his risk factors each day (is he overtired? Overstimulated?) and managing his medication is complicated w 5 doses daily. We cannot bring him to events past 6pm due to seizure risk. He also has GI issues - obstipation - do watching his intake and output each day and managing GI meds too. He cannot speak or indicate if he is in pain so often we are guessing about how he feels.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	His self injury is mist challenging. He bangs his wrists/back of hands in table tops, walks or anything with a sharp corner. He also bites his hands. He has swelling and bruising as well as callouses on hands from biting. We've tried so mushy interventions (gloves, wrist bands, competing items to hold etc) and nothing stops this behavior. We fear he will injure the nerves in his hands.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son has intellectual disability. He is a 6' tall 250 lb man body with the mental development of a toddler. He cannot speak, read, count. Etc. He uses an iPad communication system to make simple requests for food or daily activities. However he cannot express emotions, recall and share his experiences or interact in most basic ways with us.
What additional research is needed to help address co-occurring conditions for autistic people?	We need to understand underlying brain disorder that causes autism. I suspect it's related to the gut. We need to focus on the profound autism population to address these most severe needs of these individuals and their families. People with profound autism suffer from physical and intellectual disability and require 24/7 care which is devastating to the family. When families are no longer able to care for these people they require tremendous resources for care that lasts many decades. It's a huge cost yo the system that we need to address as the surge in population begins to age out of home care.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	People with profound autism face a crisis at age 22 when school services end. Many are left without programming or support. It's been called the autism cliff at age 22. Please please guarantee and find day programs and residential as needed to provide needed supports for these people and their families. Human services workers need to make a fair wage and have a career path. Oversight is needed to be sure adult placements are safe. Video cameras need to be allowed everywhere including bedrooms to protect our profoundly autistic adults from neglect and abuse.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	There is now a human services worker shortage that leaves to few day placement programs understaffed s d has created waitlists lasting years for services. We need to train and pay the direct care workers much more for the important work they do and attract them back to this field of work.

in-person social interactions and obligations)	
--	--

Name	Leslie Welch, parent of adult with autism
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Have to keep on a strict diet so they don't get sick, which means hyper vigilant monitoring of all made and purchased food and drinks. Getting to see the right specialists when dealing with bi-polar disorder as well as autism and medication. Very hard to get in with a provider who doesn't just throw medications at you.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	General public understanding of meltdown behavior so not to stigmatize both the person with autism and the family/caretakers. Getting to the best medical provider to treat the person on the spectrum, not just throw medications at them. There are very few people who truly understand the medications and how they should or should not be used in people with autism. Having general providers who understand that "typical" treatments often don't work for our family member and have strong connections with specialists and will refer you out to someone who knows better.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	children and adults with significant IDD or DD are much less able to access the trained care takers they need for 24/7 care. They often cannot be left alone for any length of time and need to be cared for by highly trained individuals. The individual may not be toilet trained -- and may not be able to be --- which means caring for a 6'3" 2 year old man in all bathroom related ways. Finding someone who is trained, caring and willing to do all these things, is rare. Determining and then finding the right placement, after they leave their parent's home, is extremely difficult. The facilities often exist but there are very few good ones. The parents do not live forever, and often shouldn't be caring for autistic adults as long as they have to, due to lack of care options.
What additional research is needed to help address co-occurring conditions for autistic people?	Care Training medications really everything
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Well funded services where the actual person supporting the individual is well trained and paid and valued. These services need to be person-centered at all times and wrap around the person needing service. They should start at diagnosis and go until death with natural progressions built in.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	During covid, the isolation was incredibly hard on our son and we couldn't explain it to him. He lost his entire world, except us, and he depends on the consistency of that world to be able to function. It was hard to access his typical drs and sometimes his medication as well.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	see previous response

in-person social interactions and obligations)	
--	--

Name	letitia smith
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	constipation (gastrointestinal)
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety ADHD RSD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	in particular need more understanding about PDA. it is becoming a more common diagnosis but understanding still very low, especially about how it different from autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	access to public services to be offered when quieter and less overwhelming so actually get to use them. however this should not be shoehorned into ridiculously early or late times so as not to impact anyone else. that is not inclusive
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Lewese, Child with ASD with PDA profile
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Severe Sensory and emotional anxieties linked to PDA profile, mismanaged at school leading to violent outbursts to the point my son is now refusing to attend school due to extreme anxiety. Locks himself in room, and barely interacts even with me. It is very stressful with no support as a single parent, while waiting for NDIS .
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Extreme anxiety with any demand leading to anger frustration and violent outbursts to myself, teachers, students, and damaging property. This reduces dramatically if my son has limited demands.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son had emotionally shut down and will not communicate his needs to others or myself, which makes it extremely hard to help him. No eye contact, barely talks despite being very intelligent
What additional research is needed to help address co-occurring conditions for autistic people?	Not just autistic children, but those with other barely recognised forms such as PDA, so it is finally recognised as a very difficult condition to manage. It's great ASD components added to schools, but not necessarily ok for children with PDA. There needs to be PDA programs as well, as it is a special way of managing them .
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More training in schools and PDA support people at each school, maybe a classroom for those children . Better and quicker access to supports. In Home Care Support on average had a years wait time for help, NDIS, 3 months just for a planning meeting, then how much longer until funding given, and no one to support me in the applications or planning meeting prep, so better access to supports to enable parents abd especially the child get the support they need. More providers, and regulations on costs, so prices are more regulated. Currently my son is on multiple waitlists for therapy, which I cannot afford to pay for until finding approved. Standardised funding for certain conditions, cause if you don't know how to prepare, or what to ask for you just don't get it.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	No idea
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced	Recent diagnosis, so not sure

in-person social interactions and obligations)	
--	--

Name	Lilja
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Our family deals with sleep issues - both myself and my child, and PDA (Pathological Demand Avoidance) - my child.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	First of all, as someone with an AuDHD brain, I do not consider ADHD to be a mental health condition. It is a difference in brain structure and behavior - just like autism is. That said, I do suffer from anxiety. Crowds, driving, loud unexpected noise, grocery shopping, etc. all heighten my anxiety.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My child deals with PDA (Pathological Demand Avoidance) as well as an intellectual disability, ADHD, and autism impacts his ability to verbally communicate. He did not speak until he was 3 1/2 years old, and utilizes scripts often. When he is unable to articulate clearly what is going on in his head, it can trigger his PDA responses (screaming, hitting, biting, breaking things, destroying things). When he doesn't understand something, it can trigger his PDA responses. When things don't go the way he planned or expected, it can trigger his PDA responses.
What additional research is needed to help address co-occurring conditions for autistic people?	PDA needs to be recognized in the USA. I believe most cases of PDA in the US are misdiagnosed as ODD. We badly need more studies in this area. Children are being punished for the way their brains and nervous systems react to a perceived threat. It is cruel and unfair. Both to the children (and adults) that deal with this, and the parents that are desperate to help them - like me.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage of course. Insurance is terrible in the US. Fewer barriers to diagnosis for both children and adults. We waited 1 year and 6 days for my child's evaluation and that was considered fast. We need more diagnosticians, and they need to be up to date with the many ways autism presents - especially in a person assigned female at birth. Far too many AFAB children who are autistic do not get their diagnosis or are misdiagnosed because they do not present like 4 year old boys. Far too many adults that slipped through the cracks as children do not get their diagnosis because they also do not present like 4 year old boys. Services cannot be accessed without a diagnosis. SSDI reform! No one can live on what the SSA expects disabled people to live on. Destigmatize Autism. Far too many people in the medical community disregard or infantilize autistic people.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic	Grocery pickup/delivery has been a huge benefit for our family. I no longer have to deal with the anxiety that grocery shopping induces. My child is no longer tempted by all the colorful things, so there is not a subsequent meltdown or PDA response when he is told he cannot have something.

people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Linda
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Other conditions" all of the above
What additional research is needed to help address co-occurring conditions for autistic people?	Other research should include what services can be provided to assist those with autism
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above should be employed
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Linda , parent of adult with autism
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My son has severe constipation, and apraxia which makes it impossible for him to communicate verbally and perform daily care tasks. Both of these conditions lead to extreme anxiety at times and difficult behaviors. My son is on a very special diet which requires cooking most food at home and can limit opportunities for social activities. He needs support 24 hours a day to help with cooking and shopping and self-care. He cannot drive or take public transportation. He cannot communicate his wants and needs verbally. He is learning how to communicate more by spelling out words and this gives us some hope.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety is pervasive in the autism community. Living with someone with autism and anxiety also increased anxiety in parents and siblings. My son has had very serious SIB. The teenage years are SO difficult for many people with autism. The SIB has decreased over the years but still appears during stressful times or when the stomach issues get worse.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The inability to communicate is a horrible situation to be in! We make assumptions based on peoples behavior that is often completely wrong! There should be a much greater emphasis on teaching communication skills in school. Part of this process also required the necessary motor skills to accurately point to pictures, words or letters. We also make assumptions that people with autism who are non-speaking, are not intelligent. That has not been shown to be the case in most instances. My son has been able to communicate by spelling and proven to us that he is smart and funny.
What additional research is needed to help address co-occurring conditions for autistic people?	The focus now needs to be on motor issues and apraxia. Not just gross motor ability but fine motor including ability to speak. We need to understand what the issues are and figure out the best ways to teach people with autism other ways to communicate using AAC, including spelling out words.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better coverage from insurance for Occupational therapy to improve motor skills. Also, there need to be more developmental optometrists as there seem to be a lot of issues with eye tracking. My son has had difficulties reading and following the words on the page. We have done eye exercises to improve this. In general, programs for adults with autism suck and are just babysitting and wasted time.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Lots of programs and services have shut down. Transportation is terrible. Programs have all been forced to become community based which is pathetic and with covid, was and still is dangerous at times.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth has been a positive change. Sometimes you do not need to see a doctor or mental health professional in person and it makes it much easier to access the support needed. In the past those telehealth sessions were not covered by insurance.

Name	Linda Gone , Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Mental health disorders, gastrointestinal disorders
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Aggression, self injurious behavior, anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Being unable to participate or have any involvement in the outside world
What additional research is needed to help address co-occurring conditions for autistic people?	There's no research in the adult population
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equity with services for individuals with severe and intense behaviors is nonexistent. Providers will not take them
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Better hygiene
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Telehealth has been great

Name	Linda Jones
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My daughter has a profile of autism called Pathological Demand Avoidance (PDA). We have been struggling to find providers who are aware of and able to support my daughter who is 7 years old. Many of these providers who are supposed to be helpful have failed to help her and have inadvertently made things worse, due to their lack of knowledge. The school system called into question my credibility when I mentioned that she has a profile of PDA as there is no formal diagnosis available in the US at this time. We are struggling with her behaviors and obtaining services from knowledgeable professionals. Our family as a whole has experienced a decrease in our quality of life because of the lack of research and information available on PDA, which presents dramatically different from typical autism.
What additional research is needed to help address co-occurring conditions for autistic people?	Research that would determine effective treatments and strategies for managing PDA is needed to provide children and families the relief that we need. Also, research that proves the existence and develops diagnostic criteria for PDA is absolutely critical. Without legitimizing PDA, there is no real way for my daughter to receive treatment and support for her condition which looks very different from typical autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Training and knowledge about PDA for service providers is the most important factor in addressing the needs of PDA autistic individuals and their families. Having a list of diagnostic criteria that is widely accepted among professionals as well as criteria for managing the disorder would change lives. It is extremely frustrating to reach out to professionals who are supposedly knowledgeable about autism only to find that they are absolutely useless, if not harmful in their ignorance. As a parent, being the one who has to inform providers about my daughter's needs is extremely frustrating and disheartening. We need real advice, real support and real treatment for our daughter.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic	

people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	
---	--

Name	Linda Kline, DDA SDS Family As Staff Direct Support Staff
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	When staying overnight with Special Olympics they have a no prescription medical cannabis regulation which is problematic because conventional prescription drugs didn't work for my son's sleep disorder and off of those pills he was lucky to get 0 to 3 hours of sleep per night, prescription medical cannabis always 6-10 hours.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am lucky, my son has no mental issues, he is only Neurological as that is what Autism is, neurological not mental.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Proper social and keeping the conversation going.
What additional research is needed to help address co-occurring conditions for autistic people?	Well, number 1 the schools need to put Music Therapy in the school setting and number 2 the schools need to have Recreation Therapy and eating therapy. My son had all of 3 of those therapies in the school setting from 1990-1996 and when I moved back to Maryland and was told he couldn't have Music or Recreation Therapy in the school system I was crushed, thankfully Huntington Autism Research Institute and Ewing School in Marietta Ohio trained all of us parents to perform these 2 therapies, so my son was still getting it even though the state of Maryland is way behind Ohio. Put that [profanity redacted] in the schools for our Autistics the way Ohio had it.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Permit family as staff to work over 40 hours per week whenever the need is there, I am my son's only staff and I can tell you he has way more than 40 budget hours per week and I do them all but only get paid for 40.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	We are tired of people trying to get us to take the [profanity redacted] jab. After I watched the 3 shots my mom take kill her immune system, and after the 2nd shot my dad had a massive stroke that sent him on a life flight to Altoona PA 4 weeks before Christmas in 2022....and after having 4 of my own physicians tell me NOT to get it, trust me I don't need it. I haven't had Covid the entire time, not once, I don't mask either, I refuse to as it was causing my Rosacea to go up into my eyes and had constant eye styes, so them [profanity redacted] face diapers are trash.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on	There is a Head Coach in Washington County Special Olympics that wants my son jabbed so bad with the Covid injection, he refuses to invite him to State Competition using the excuse you aren't injected, well that's nice he don't

physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	have to be to participate at state level and that's discrimination and our representatives got an email about this.
--	---

Name	Linda Luxenberg, Parent and Professional
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Lack of understanding of processing, sensory and communication sensitivity which effects behaviors.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Communication by behavior when accommodations are not provided. Self injurious behavior requires adequate support to understand and treat issues such as OT/PT and, of course, communication.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Medication used to treat rather than evidence based interventions such as structured, predictable and consistent treatment. Poor staffing leads to poor programming.
What additional research is needed to help address co-occurring conditions for autistic people?	Vermont is at the bottom of the learning curve; yet, boasts its philosophy is superior. When families express concerns the VT system, rather than addressing the systemic failures, retaliates against parents by taking over guardianship. States lacking expertise should send not receive Fed funds. Money talks.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Vermont is administrative heavy and direct service provider light. Furthermore, the administrators lack knowledge about autism.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	More reasons for the vermont system to whine about the "staffing crisis," which was problematic prior to Covid.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Less large social gatherings is a plus for some people, particularly true of those on the autism spectrum.

Name	Linda Schepis
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory regulation challenges impede attention and learning.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, again impacting attention and learning.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Feeding disorders.
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Automatic referral for evaluation and treatment by Occupational Therapy. I have yet to meet an autistic child and family who does not need this. Get rid of ABA (see all the mental and physical health harm it causes). Provide respite care to families that is not ABA-based. Help families navigate the process of entering preschool as soon as they turn 3 years of age.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Linda, Parent
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	GI problems- co Stilton and GERD mainly Sensory and motor challenges. Unsteady gate. Sleep issues. Too little and trouble sleeping. Frequent pain. Headaches and stomach aches mostly.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Self injury, irritability and aggression/violence toward others. High anxiety.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Can't speak, Incontinent, difficulty learning to use communication device. 19 yo with developmental ability of a two-three year old.
What additional research is needed to help address co-occurring conditions for autistic people?	We need research In The causes and treatments for autism and their co occurring conditions so we can improve their health and quality of life.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Private insurance needs to cover things that Medicaid does for those that can't get Medicaid. IE therapies, pull-ups, diapers, OTC meds that help. Long waiting lists for help needs to be resolved and/ or at least decreased. Don't make us jump through hoops and all kind da of red tape to get help.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	None for us.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Hard to get help, waiting lists, telehealth has been a benefit bc it's hard to go places and waiting is always an issue due to hard time waiting.

Name	Lisa
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I personally experience gastrointestinal issues, motor challenges, and insomnia
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I personally deal with anxiety, burnout, ADHD, processing issues, and have dealt with suicidal ideation
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I personally also h
What additional research is needed to help address co-occurring conditions for autistic people?	Hearing from the personal experiences of those who have autism from different settings and demographics
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Services that focus on bettering the individuals life such as life skills, job help, making sensory management more accessible. Currently behavioral management helps but many use it as an end-all. Many individuals both children and adults are left helpless when it comes to anything other than correcting behaviors. Sensory management can become more accessible with making items like noise cancelling headphones, weighted items, sensory tools etc more affordable and accepted in professional academic settings. Many individuals especially adults also do not have access to accommodations in higher education or professional settings. Accommodations that allow individuals to perform better help such as longer test times, staggered deadlines can help.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Positive: remote options, telehealth as these can be accommodating to autistic individuals. Negative: reduced in person interactions have caused many including myself to regress.

Name	Lisa Graf
Demographic	Family member of an autistic individual; Service provider, health provider, or educator; Other
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The biggest physical impact on my son is gastrointestinal, hypermobility, weak muscle tone and sleep issues. I am undiagnosed but likely on the spectrum. I also have gastrointestinal issues, chronic pain issues, hypermobility of joints, and migraines.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Executive functioning and anxiety are the two biggest issues.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I've worked with students on the spectrum with a wide range of abilities and additional disabilities. The additional layer of autism primarily adds social/communication issues. Sometimes students do not understand instructions or explain things unclearly. Sometimes it is the uneven maturity (young socially but knowledgeable). Sometimes it is the inability to verbalize when frustrated or distressed.
What additional research is needed to help address co-occurring conditions for autistic people?	I think a medical records study looking at different rates of people with autism, people with family members with autism and people without to identify what truly is common.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Better access to disability services and better supports for employment.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	My son has a lot of anxiety about the epidemic. He still masks in school by his choice. He has had covid several times. We think he has PANs now but not sure what virus caused it.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Access to mental health services has been limited here in Indiana with very long wait lists, It seems to be getting better. Telehealth has been great as has remote schooling when ill. He has been sick more this year.

Name	Lisa Jeanne Geaf, 2023 LEND fellow
Demographic	Autistic individual, Family member of an autistic individual, Researcher, Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	autistic burnout because it is so common and impacts so many people
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Autistic burnout
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Lack of accommodations for communication differences. Accommodations include written notes and communication and closed captioning.
What additional research is needed to help address co-occurring conditions for autistic people?	There is too much focus on changing autistic people and not enough on changing environments and expectations to make relationships and spaces more welcoming and accepting.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	I would love access to services like house cleaning, Acupuncture and financial support to pursue and enjoy special interests. Improving quality of life is important.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Better access to closed captioning, community meetings and written communication accommodations. Problems are less safe access to the gym for exercise. Would love wood land hiking clubs as an option.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Largely positive but lately I am craving and sealing out more one on one visits in real life not virtual.

Name	Liv
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Not being taken seriously by medical professionals and the cost of healthcare
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	not being taken seriously by medical professionals and the cost of healthcare
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	cost of seeking help
What additional research is needed to help address co-occurring conditions for autistic people?	how to provide free healthcare to all
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	reducing cost barriers by giving everyone free healthcare
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	its too expensive to live a life

Name	Liz
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Epilepsy, anxiety taking medication
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety taking medication for epilepsy
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Dyspraxia, comprehension issues
What additional research is needed to help address co-occurring conditions for autistic people?	
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, staff that understands epilepsy, not being ignored or treated like everyone else that may not have epilepsy with autism
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Staffing issues have changed dramatically since Covid 19,

Name	Liz Martineau, Nashoba Learning Group
Demographic	Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Many in our severe/profound autism population suffer physical pathologies that can severely compromise well-being, to the point of being fatal. These include catatonia, epilepsy and seizures, gastrointestinal distress, insomnia and sleeplessness, and sensory overload. These pathologies can be ruinous to quality of life for the individual and family. They cause suffering and often, premature death.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	In our severe/profound autism population, behavioral pathologies are pervasive and can severely compromise well-being, to the point of being fatal. These include aggression, self-injury, property destruction, pica, and elopement. The underlying cause may be anxiety or simple frustration at an inability to communicate. Aside from death, common consequences include bruises, lacerations, scarring, broken bones, ripping out of hair, and skin infections to both the afflicted individuals and their caregivers. Repeated self-injury can cause detached retinas, cauliflower ears, and traumatic brain injury. Pica can cause our individuals to ingest toxic inedible objects. These are more than "challenges," they are lethal or traumatic injuries that often require emergency medical treatments, surgeries and complicated, costly hospital stays. In addition, OCD is often co-occurring and can cause individuals to engage in rituals and routines that are dangerous and engage in dangerous behavior if those routines are interrupted.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Profound Autism, by definition, includes intellectual disability and communication disability. This combination of disability leads to profound challenges for individuals and their caregivers and a need for individualized teaching and behavior support. This segment of individuals has dramatically different needs than others with Autism and research should be directed to the specific needs and challenges of this population.
What additional research is needed to help address co-occurring conditions for autistic people?	A top research priority for our severe/profound autism population is the alleviation of distressing and too-often fatal behaviors of aggression, self-injury, property destruction, pica, and elopement. There is a desperate need for more efficacious medical and behavioral treatments, and of course more understanding of routes for prevention. We need more research on: psychiatric medications; and behavioral approaches. Much more emphasis must be placed on the needs of adults who often lack access to appropriate care and whose dangerous behaviors cause enormous burdens to families and care providers.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	With urgency we must foster a much larger and more robust network of care providers in all states to address the care needs of this rapidly growing population of individuals with Profound Autism. In particular Adults with Profound Autism need funding and access to intensive supports. We provide these supports at NLG but incur a substantial financial deficit because funding doesn't contemplate the intensive needs of this population.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to	The Covid shutdowns have had a lasting devastating impact on programs serving individuals with severe and profound autism. Many programs,

the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)

particularly those serving high-needs adults, have shuttered, leaving many adults almost completely isolated with no access to day habilitation or community engagement. This also causes their families/caregivers to be isolated and often unable to work. Our program remained open but the costs of hiring and retaining staff with the appropriate skills have skyrocketed and are not adequately reflected in the funding we receive.

Name	LizC12, Self
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I'm currently getting further testing due to chronic pain. Part of said pain is severe gastrointestinal pain that also causes extreme nausea and even severe vomiting. I do not sleep well. I also. Have sleep issues, either i cannot fall asleep or I cannot stay asleep without the aid of a prescribed muscle relaxer. Not to mention certain textures, sounds, smells, flavors, and lights make me extremely uncomfortable, or icky
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I have ADHD, Generalized Anxiety Disorder, and Major Depressive Disorder. I have difficulties staying g on topic when speaking or jumping from topic to topic rapidly, or getting stuck on a particular topic. There are days where I have panic attacks that are hard to get through. The days where the depression hits hard... it hits HARD. Combined, it's as if the whole world is sitting on my chest. I don't want to wake up
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I find it difficult to tell if people are being serious with me. Sometimes I don't know how to think of a good response to things people talk to me about. I always had issues with numbers in school, terrible at math.
What additional research is needed to help address co-occurring conditions for autistic people?	Definitely more research on women and girls. Testing for these things earlier. Believing the things a patient is saying, not gaslighting them or making them think they're just crazy.... I was a late diagnosed autistic female. If I had earlier testing, doctors who listened sooner (and parents who believed in these things), I might not be as bad as I feel I am today.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	More coverage from insurance for tests, for accommodation tools (walkers, therapies of any kind, etc). Better access to these tools, not having them cost more then, a minimum at best, a third of average rent in one of the most expensive cities in the US. Thousands should not have to be spent by a disabled person to have an accommodation or test or procedure that they need
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Lori Hogenkamp, Center for Adaptive Stress
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The Evolutionary-Stress Framework (ESF) from the Center for Adaptive Stress views autism as part of a complex adaptive system, focusing on neurodiversity as an adaptive response to environmental and internal stressors. In this context, co-occurring physical conditions in autistic individuals, such as gastrointestinal issues, sleep disturbances, epilepsy, migraines, and sensory or motor challenges, are deeply intertwined with mental and cognitive health. These conditions are seen as part of a spectrum of inflammatory regulation issues, reflecting neurotype-specific stress responses and trade-offs. Understanding these conditions through the ESF lens suggests that both physical and mental health issues are interconnected, necessitating a calibrated approach to treatment. This involves fine-tuning various health aspects to achieve a balanced state, recognizing the unique stress adaptation patterns of each individual. An ESF-based approach to care emphasizes ecosystem-focused, personalized interventions, considering the complex interplay of factors influencing health in autistic people. This perspective shifts the focus from treating isolated symptoms to addressing the broader adaptive context of health and well-being of emergent allostasis.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Addressing challenges faced by autistic individuals with co-occurring mental health conditions requires a nuanced, systems-based approach. Key challenges: Complex Neurodevelopmental Interplay: Autistic individuals experience unique interactions between their neurodevelopmental traits and mental, developmental and cognitive health issues, necessitating dynamic understanding and treatment strategies. Individualized Stress Responses: These individuals often have distinct stress response patterns, which are further complicated by mental health conditions like anxiety, depression, or ADHD. Standard treatment approaches may not be effective, highlighting the need for personalized care. Access to Tailored Healthcare: There's often a lack of healthcare services equipped to address complex needs of autistic individuals with co-occurring conditions. Quality of Life Impact: The combined effects of autism and mental health conditions significantly affect social interactions, education, employment, and daily functioning. Healthcare Navigational Difficulties: Families often struggle to navigate healthcare systems to find comprehensive care. Integrated Care Models Need: There's a crucial need for integrated care that addresses the interconnected health needs of autistic individuals. Addressing the significant challenges faced by autistic individuals with co-occurring mental health conditions requires a nuanced, systems-based approach.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Autistic individuals often face complex challenges due to co-occurring conditions like learning and communication disabilities. The Evolutionary-Stress Framework (ESF) views these as part of a complex adaptive system where each condition interacts dynamically, akin to varied weather patterns in different climatic zones. Traditional healthcare approaches tend to treat these conditions separately, leading to suboptimal care for autistic adults, who commonly have intertwined health issues. This fragmentation overlooks the interconnected nature of these conditions and their collective impact on an individual's health and well-being. The Center for Adaptive Stress advocates for a systems approach, treating these co-occurring conditions as a cluster or constellation. This shift from a fragmented to an integrated treatment model focuses on emergent allostasis, recognizing the adaptive stress responses unique to each neurotype. By understanding the interplay

	<p>of these conditions, healthcare providers can tailor interventions more effectively, aligning with the diverse neurotypes of individuals. This approach, considering the interactive nature of disabilities and societal influences, promises more effective, personalized care and fosters a society that values neurodiversity and resilience.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>To enhance research on co-occurring conditions in autistic people, it's essential to integrate complexity and systems models. This approach would focus on the unique manifestations of conditions across different neurotypes, rooted in their distinct neurobiological configurations. Research should particularly explore non-linear patterns and stress mechanisms, understanding conditions like depression or anxiety as integral components of the neurodiversity spectrum, specific to the neurotype's adaptive responses. Reframing the narrative around these conditions is pivotal. Instead of viewing them as deficiencies, we should consider them as part of a spectrum of adaptive-maladaptive trade-offs. This perspective aligns with principles of complexity, evolution, and neurodiversity, paving the way for a transformative model in medicine. Here, conditions are recognized as inclusive and evolutionary adaptations. Further, studies should delve into individualized health concepts like 'emergent allostasis', investigating neurotype-specific stress responses. By viewing co-occurring conditions as interconnected elements within complex adaptive systems, we can gain a deeper understanding of neurodiversity and its implications for health. This approach not only promises targeted interventions but also informs policies that support a more inclusive and nuanced healthcare system.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Improving autism services for co-occurring conditions involves:</p> <ul style="list-style-type: none"> Integrated Care Models: Collaboration among healthcare professionals to address both autism and co-occurring conditions comprehensively. Personalized Treatment Plans: Emphasize emergent allostasis by tailoring support to individual neurotypes and stress responses, considering the dynamic nature of each person's health. Professional Training: Enhance training for professionals in systems-based approaches, emphasizing the complexity of neurodiversity. Develop holistic assessment methods for accurate identification of co-occurring conditions, respecting the interconnectedness of neurodiverse traits. Family and Caregiver Support: Provide resources, education, and support networks, acknowledging the crucial role families and caregivers play. Accessibility of Services: Ensuring all individuals can access necessary care, reducing financial and geographical barriers. Inclusive Education: Tailored educational strategies and support within schools for diverse learning needs. Mental Health Support: Adopt specialized therapeutic approaches that view common mental health conditions as part of the neurodiversity spectrum. Research Investment: Broadening research to include community-based studies on stress and quality of life, alongside top-tier research. <p>Collaborative, interdisciplinary efforts are key, respecting self-determination and providing continuous support.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>The COVID-19 pandemic highlights the need for comprehensive stress models, particularly for individuals with long-term impacts like autistic people. Key insights:</p> <ul style="list-style-type: none"> Physical-Mental Health Interconnection: The pandemic shows the link between physical conditions (obesity, heart disease) and mental and cognitive health impacts through proinflammatory responses. Inflammatory Regulation and Trade-Offs: The Evolutionary Stress Framework developed by the Center for Adaptive Stress suggests stress responses, including inflammation, are neurotype-specific adaptations.

	<p>Understanding these as part of a broader health system is crucial.</p> <p>Calibration in Treatment: Current models often oversimplify stress as a direct cause of health issues. ESF advocates for a calibrated approach, adjusting various health factors for optimal support. Chemical, Physical, and Social Stress Factors: Factors like cytokines (IL-6, IL-7, IL-15) are significant in stress adaptation and immune response, especially under social isolation. These should be integrated into health support models. COVID-19 underscores the need for dynamic stress models in healthcare, accommodating the complexity of individual health responses, especially in autistic individuals and those with neurological disabilities.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The COVID-19 pandemic has profoundly impacted the physical and mental health of autistic individuals, highlighting the necessity for neurotype-specific care and a deeper understanding of stress mechanisms. Autistic people's unique responses to stressors like a global health crisis require personalized healthcare approaches, especially considering the varied symptoms and recovery patterns in 'long COVID.' Mentally, the pandemic has intensified stress, anxiety, and isolation, disrupting routines and increasing sensory challenges. This situation calls for a reassessment of mental health support, focusing on interventions tailored to the specific stress response patterns of different neurotypes. The pandemic also presents a chance to reform healthcare systems, emphasizing integrated care models that concurrently address physical and mental health. For the autistic community, strategies informed by the complex interplay of neurotype, stress mechanisms, and environment are crucial. In summary, the lasting effects of COVID-19 on autistic individuals emphasize the need for an ESF-aligned approach in healthcare, focusing on neurotype-specific care to effectively address the unique challenges of this community</p>

Name	Lori, mother of 32 yo with autism
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	trouble sleeping due to compulsive thoughts; motor challenges, particularly when walking (sometimes just falls down)
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression, anxiety, self-injurious behavior
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	When my daughter is overstimulated, she often cannot speak as her brain cannot formulate words to speak. Also, during times of overstimulation (meltdowns), my daughter, if she can speak, must talk very, very slowly to be able to articulate every word as it forms in her mind and flows to her mouth (this is how she explains it to me)
What additional research is needed to help address co-occurring conditions for autistic people?	So much research needs to be done to help health and human services providers better understand that, although a person with autism may seem to be able to function independently, often there are areas of gray where their independent abilities fall short. Along this line, research that really focuses on the multitude of ways a person with autism may present themselves both to people they know and people they don't know. Any research would be good - oh yes, and, really important to me is research on adults with autism. I am so tired of reading about all the new research and practices for infants and children that it seems like people forget that children with autism grow up to be adults with autism.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	First, I would say more funding needs to be made available. My daughter has been on a wait list since she was 18; she is now 32. Because she can "cook, clean, and bathe herself," no one thought she needed support, such as independent living skills. I guess they thought I would take care of all that, which I did, out of my own pocket with money I don't have. Insurance coverage - Medicaid - ugh. Why are there so many different Medicaid choices? If a doctor takes Medicaid, then they should be required to see any client who has Medicaid as their insurance coverage. Education of any/all health or human service providers. If a person with autism says they don't understand a question, don't just repeat the question - rephrase the question. Finally, even though we are on a wait list - no one follows up. I, as her mother and caregiver, have to make all the effort to get information about whether or not she might now qualify for assistance. In the meantime, I'm all she's got and, like many aging parents, I lose sleep at night wondering how she will ever adjust after I'm gone since no resources have been made available to her at this late stage in her life.
What lasting impact has COVID-19 infection and illness had on co-	My daughter is a rule follower. It makes her very nervous when/if people didn't wear masks. Research said we should wear masks so she couldn't understand why people weren't doing what was best for them and everyone

<p>occurring physical and/or mental health conditions for autistic people?</p>	<p>else. This caused her a great deal of anxiety and made it hard for her to venture back out after the pandemic was considered over.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Loss of direct care workers - even though my daughter is still wait for services, the loss of the direct care workforce and other service providers will probably delay even longer the amount of time we/she waits for the assistance she actually needs, despite what they said when she was 18.</p>

Name	Louis
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As an autistic adult, some of the things I struggle with most because of my current co-occurring conditions are pain, fatigue, motor control issues , and worse quality of life. The symptoms that I have make it so it is difficult for me to hold a job, to focus in school, to maintain an income above the poverty line, be mobile around my daily tasks, and I struggle with activities of daily living. Other experiences as an educator and advocate support many of these same struggles, though the reasons behind the struggles may differ slightly. For example, while my gastrointestinal issues do cause me great discomfort and can interfere with life, I have seen other autistic individuals who have lack of bowel control or extreme pain. This, similar to my co-occurring conditions causes dysfunction in both basic and instrumental ADLs.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	In my personal experience, anxiety especially social anxiety, can be incredibly debilitating in interacting with others. ADHD also makes it difficult with executive dysfunction and added difficulty with social interaction. I have a number of different co-occurring mental conditions, which in of itself presents a lot of challenges as many providers do not know how to help my case, and I've seen the same issue in many of my autistic friends and family. Another major struggle that I see in the community is the prevalence of trauma. The effects of trauma can create a lot of dysfunction and heightened sensitivity to the environment. There are not many good medications for this, so I know many people are left without good treatment. I think another problem that arises with more externally presenting behaviors like self injury and aggression, that this comes with a lot of stigma and lack of education on the sensory conditions that lead into these meltdowns. This can cause interactions with police officers that are incredibly damaging, interactions with peers that are ostracizing, interactions with educators that are punitive. There needs to be better measures and education on this behavior to help destigmatize these conditions.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I think one of the biggest places I see problems with co-occurring disabilities in learning, communication, and intellect is education. Education systems are set up to teach neurotypical students, and so those with co-occurring conditions are subject to isolating environments, where individuals are not learning at the same level as their peers, and not given the proper accommodations to meet those needs. I also think a big problem is undiagnosed learning, communication, and intellectual disabilities as this is met with more punishment from the school system and internalizing negative self-esteem. I've seen autistic adults who have co-occurring conditions who have deep wounds and Trauma from their time in the school system. We need a major reform to both mainstream and special education classrooms to better accommodate students with co-occurring conditions. Another issue I see, is people who have co-occurring conditions in Care Homes where they are privatized, creating a highly restrictive environment. Individuals are not given the level of autonomy that they could be given. For example, many individuals in care homes with these co-occurring conditions, are not allowed to go out and engage in adult activities like going to a bar or club, they are required to abide by strict curfews, and because of poor working conditions see a high turnover in caregivers creating an unstable environment and escalating meltdown behavior.

<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>There needs to be more research from the perspective of autistic individuals, including opportunities and grants for autistic researchers and specialists who have a particular interest in autism. I see a major need for more research into treatments of co-occurring disorders, instead of individual disorders. Often, studies are separated into autism as a condition, or a co-occurring condition as a condition of the study. This ignores any synergistic effects of having both and how they affect one another. For example, major attention needs to be drawn to how autistic individuals communicate with care providers and how that affects their treatment. Also needs to be more research on adults, with attention paid to diversity as currently much of the research is fairly homogeneous in its sample.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>Expanded services for adults as there is currently little support for autistic adults and their co-occurring conditions. More attention to how diversity impacts co-occurring conditions, especially the impacts of race, sex, gender. Insurance coverage through universal access for autistic individuals is necessary considering the number of co-occurring and conditions that complicate the lives of autistic individuals. Government sponsored Healthcare is a major step in the right direction, as is many autistic individuals utilize government support because of the disability that co-occurring conditions with autism causes. More education in the school system, doctors offices, and at a university level needs to happen in order for autistic individuals to receive proper treatment for the co-occurring conditions that often they have to bring to people serving them. Additionally, there needs to be more consideration in counseling for autistic individuals as currently many autistic individuals feel they cannot find a therapist who understands autism and co-occurring conditions. Another major change that needs to happen is better Social Security Programs, for income accessibility for autistic people with co-occurring conditions is attainable. Considering the high number of unemployment among autistic individuals, it is absolutely crucial that there be safety nets in place so that a vulnerable population is not marginalized further.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>In my experience, I have had long covid and chronic fatigue syndrome as a result of the covid-19 pandemic. Myself and many people I know have really struggled with returning to social life even years after the pandemic, and feel there's been a sort of loss of social skills and regression of other skills mental and physical as a result. I think many are still feeling the fall out of the isolation, causing increased anxiety and depression. As for existing conditions prior to the covid-19 pandemic I and the many other autistic people have experienced increased symptoms of these conditions like increased pain, fatigue, musculoskeletal issues. Another effect that I have seen is anxiety around sickness and health.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>Some positive changes as a result of the covid-19 pandemic is that many providers now offer a Telehealth option and a lot more jobs ate remote increasing the ability to work from home which is often necessary with co-occurring conditions. Another positive, is is expanded access to online ordering decreasing social interaction which reduces social anxiety. I was able to get an undergraduate degree during this time because of the increased access to online school and that wouldn't have been possible previous to the pandemic . I think several autistic people got some social advantage during the pandemic as these opportunities became available. Some of the negative impacts that I've seen, is the pressure to get back to work and recover the economy when many of us have new conditions. The increased prices of everything makes it harder for autistic people with co-</p>

	<p>occurring conditions as many of us were already living below the poverty line and that has only increased after the pandemic. A lasting social impact for minority stress, is the knowledge that many providers could do Telehealth because they did during the pandemic, but now they've refused to do it, showing a lack of accessibility. Another lasting impact is the provision and removal of government services, where many services were expanded during the time of the pandemic which helped many, but now the services are reduced again making it very difficult for those who are reliant on services because of the strict regulations.</p>
--	---

Name	Louise
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	A lack of understanding from healthcare professionals. Difficulty in using verbal communication to give a clear history to healthcare professionals. A tendency to underestimate the severity of symptoms due to the different ways autistic individuals communicate.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Lack of understanding from healthcare professionals regarding the difficulties in communicating distress. The expectation that people will automatically engage with a neurotypical approach to assessment, No understanding of selective mutism, alexithymia or interoception.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Having no learning / developmental or intellectual disability underplays the significant, yet hidden disabilities that autistic people experience. Looking “normal” and assuming neurotypical characteristics is highly distressing.
What additional research is needed to help address co-occurring conditions for autistic people?	Gathering the information from healthcare professionals about their preconceived ideas about what autism is and how it presents. These assumptions and preconceptions need to be challenged.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Reduced waiting times for assessment in the first instance. Post diagnosis support, advice and information, with practical examples of how to navigate the system of health and social care.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Increased waiting times for assessment. Lack of available support without a diagnosis.

Name	Luca Hardt
Demographic	Autistic individual; Family member of an autistic individual; Service provider, health provider, or educator
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Scoliosis and other skeletal differences are more common in people with autism. I had a full spinal fusion when I was 11 due to severe scoliosis. I have chronic pain twenty years later and permanently limited mobility. My liver is unable to process certain medications. A low dose of sertraline caused me to enter serotonin syndrome. My concerns were dismissed by my psychiatrist as my flat affect led her to doubt my self-reported symptoms. I suffered sterile meningitis. I was unconscious or in status epilepticus for 2 days before being found and taken to a hospital. I still have seizures and must take medicine. My diet and behavior are limited due to sensory issues. I love to cook well-rounded meals, but I am not able to eat them. My diet is mostly processed foods as they are uniform and consistent. I eat too little and my digestive system is slower than most. I am frequently bloated and constipated. I must plan my errands for when there will be little traffic, and when stores will not be busy to accommodate my sensory needs. I can only manage one errand a day usually, and must nap after. I sleep approximately 3 hours at a time, with a few hours of wake time between. This is incompatible with work or life, but I am not able to make myself sleep more. 1.5mg of melatonin leaves me tired the next day, more gives me night terrors, less and I will not stay asleep. My brain's preferred sleep schedule is 2-4 hour naps, 2-3 times a day.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I am constantly made to second-guess my perceptions and feelings. I have been labeled depressed because of my flat affect and frank way of speaking. When I say people seem to distrust or dislike me upon meeting me, neurotypicals hear negative self-talk. My lived experience is that people think I am weird, I make them uncomfortable. My diagnosis helped to confirm that. The problem was not depression, it was that I was treated differently because I am autistic. The problem was not anxiety, it was that I have sensory issues. Being gaslit or dismissed by authority led to poor mental health and self-doubt. My seizures are primarily triggered by stress, made worse by lack of sleep or food. Unfortunately, the world stresses me out. I am constantly afraid to trigger a seizure. I can't afford another emergency. I have lost multiple jobs because I couldn't drive, even working from home. I have worked in disabilities social work, mental healthcare, and behavioral health. Never have my seizures been accommodated. I know better than to report my autism or ask for accommodations. I have always been passively suicidal. I have been told, directly or indirectly, that the world does not care about my needs, and will not accommodate them. Every day is difficult. Every day is exhausting. I want to live in a world with mutual aid, community, support, but that's not the reality. I am an adult that struggles to keep a job, and for that I will never thrive.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I was forced to mask from an early age. Masking is exhausting. It is taking years to unlearn and find myself again. At 30, I hit autistic burnout and entered major skill regression. I was nonverbal for six months. I was unable to leave the house or care for myself, or reach out for help. My partner has been my lifeline. I'm still recovering. I'll take any chance to rant or write about my interests - like autism, especially my own autism. Still, this form has taken me six weeks to fill out. And there are so many autistic voices who cannot contribute. I was diagnosed in my 20s. As a child I was hyperlexic, teaching myself to read before I was forming permanent memories. But there was no comprehension, I was stimming on letters. School was a game, memorizing information just long enough to get a high score. But I refused to

	<p>do busywork. Beating or failing me didn't motivate me. Still I have no tolerance for things that aren't my current hyper-focus. Because I did well academically, my lack of social skills was overlooked until I was a teen. Overnight I went from genius child to social pariah, without having changed my behavior. Miscommunications are seen as malicious, asking clarifying questions is questioning authority. I don't know how to close this gap. I'm not confident I've answered these questions in any sort of competent way. I struggle to know what is obvious, what is only personally relevant, what is fluff, and what is vital to the reader's understanding.</p>
<p>What additional research is needed to help address co-occurring conditions for autistic people?</p>	<p>The hoops one must go through to obtain a research position are incredibly difficult to overcome for many autistic people. Support in all levels of education for people who are neurodivergent could lead to better research. Autism research done by neurotypicals often borders on hatefulness. Starting with autistic researchers will help guide research on autism in positive directions. No one knows our needs better than us. Research on supports needed by otherwise employable autistic adults needs to be furthered. For many positions, there is no reason that working hours couldn't be more flexible or for employees to be constantly plugged in and ready to chat. These expectations have me in constant fight-or-flight. Even in a job I enjoyed and felt supported in, my office hours became closed-door spiraling on the floor while waiting for an approaching meeting. Positions that promise autonomy still keep tabs on you during working hours. These positions are unobtainable for the autistic people who weren't able to go to college. There are many brilliant minds not being put to work because of the antiquated expectations of work. Also further research into the outcomes of ABA therapy needs to be funded, as it is dog training for disabled children and abusive. It leads to adults with crippling PDA profiles because it is abusive. It is militant abuse to force children with autism to ignore their needs for the comfort of the neurotypical people around them.</p>
<p>What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)</p>	<p>It currently costs approximately \$3000 out-of-pocket to be officially assessed for autism. At the point when assessment is accessible, it is likely already more or less confirmed by a therapist that one is autistic. Talking to a doctor is very hard for me. Things that may be different about my body are all I know, so when the doctor asks if I have any questions or concerns, I draw a blank. I'm not given dialogue options in the exam room, so I have no idea what I need to bring up. I am not able to argue with a claims adjuster on the phone, I know they are attempting to take advantage of me and I know they are easily able to. Because of the unexpected charges I may incur at any step of the process of receiving healthcare, I am more likely to simply never see a doctor. Just making the call to make an appointment triggers a vasovagal response. I am not able to navigate the healthcare system, especially as a labeled disabled person. I was told I qualify for disability, but every attempt at seeking help has been in vain. Social workers don't respond to phone calls, when I tried to do it myself, I was rejected. I was told that accessing disability would leave me unable to marry my partner and that a case worker would have to monitor me to ensure I was really disabled (hell). I stopped pursuing help, because I could not handle the social, hierarchical, performative process of being helped. There is an overwhelming impression of the system wishing I simply did not exist.</p>
<p>What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?</p>	<p>I was working in a group home for teenage boys with autism when the pandemic began. Their routines were severely disrupted and they did not understand why. This led to high stress and restlessness in all of the boys, which led to violent behaviors. Staff were frequently injured, and the use of</p>

	<p>safe restraint became a daily occurrence. With a lack of previously available options due to shut downs, damaged property and sensory equipment, lack of maintenance workers, and shipping delays, fighting staff to invoke safe restraint became a sensory activity. There was an incredibly high rate of turnover at the house, meaning the boys could never form necessary bonds with new staff. We were frequently understaffed. Female staff were assaulted while working with boys who were supposed to be male staff only due to a history of inappropriate sexual behaviors. Multiple established staff members had to leave due to injury. The trauma of the pandemic set those kids back years and created many, many dangerous habits. My persisting brain fog is potentially linked to multiple exposures to COVID. I have received every booster and vaccine, but still I have had COVID 4 times. The virus seems to affect me worse than others. In the last four years, I have declined in functioning. My relationships and ability to work have suffered. I had to drop out of my MSW with only 6 months left. Due to the way I was treated once I was obviously disabled, I will not go back.</p>
<p>What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)</p>	<p>The pandemic demonstrated that capitalism does not care about disabled people, especially those with high support needs. COVID is mostly fatal for those with pre-existing conditions, after all. Corporations raise prices arbitrarily while wages stagnate. Companies demand loyalty and productivity without returning it. People do not feel safe in or appreciated for their work. COVID protocol was lifted prematurely, leading to surges in infections and more people permanently disabled. Disability services were deemed essential but the pay was made unlivable. Many of the systems adapted during COVID showed us that society actually could be more accessible to disabled people. Telehealth was a good option but is no longer offered. Healthcare workers no longer mask. Remote work is nearly impossible to find. My city council member ran on a campaign of filling downtown office buildings and ending remote work. Given a remote position with autonomy and limited communication, I could thrive. During the pandemic, many people stopped working long enough to consider their health. Many found out they were autistic. They found out they were disabled during a mass disabling event in which our government and culture demonstrated it did not care about people with disabilities. I believe this too has led to a surge of support for Palestinian resistance, as their genocide is another mass disabling event sponsored by our government. COVID changed everything.</p>

Name	Lynn Cass
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	My situation with son is 2-fold. His epilepsy, sleep disorder, sensory challenges and self-injurious behaviors cause his pain and discomfort as well as significantly limit the activities, even so-called disability friendly activities, that he has available to him. He in turn becomes more isolated and less likely to do any activity. In addition, due to the fact that he's nonverbal is it very difficult to find a medical practitioner who is willing and able to treat him and take our concerns seriously.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	For our family self-injurious behaviors and anxiety significantly limit our son's ability to participate in many activities outside of our home.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	My son is nonverbal, along with intellectual disability. This makes it almost impossible for anyone but his immediate family to be able to understand and communicate with him.
What additional research is needed to help address co-occurring conditions for autistic people?	I think the best research you can do is to actually listen to families like ours who live this reality every day. We can certainly tell you what is needed to improve the quality of life for our family members.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	It would help to make it part of the priority to address the individuals on the more severe end of the spectrum; those with significant behaviors, nonverbal, not candidates for competitive employment, those who require 24/7 specialized care.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Several day programs, including the one my son attended, have shut down or decreased capacity since the pandemic. Those programs that still exist are not suitable for an individual with needs such as my son's.

Name	M
Demographic	Autistic individual; Service provider, health provider, or educator; Researcher; Representative of advocacy organization
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	getting accommodations discrimination Sensory challenges finding healthcare
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	depression anxiety ADHD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	intellectual disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	barriers to accommodations
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	access to accommodations
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	depression anxiety lack of financial support
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	lack of boundaries and structure increase workload lack of in person interactions when it comes to requesting accommodations. prejudice by services that are available to provide accommodation in certain educational field such as the USMLE disability boards and Law School Admission Council (LSAC) disability boards.

Name	Mabel Thomas
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Restricted eating, interrupted sleep, sensory and motor challenges, behavioral expression of disability
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Anxiety and self injurious behaviors, as well as injurious behaviors towards others
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Developmental and communication disabilities
What additional research is needed to help address co-occurring conditions for autistic people?	PDA as a nervous system disability and its supports
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	All of the above.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Maci Barbour
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Joint dislocations, Gastroparesis, chronic pain
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Depression, anxiety, social anxiety
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	Speech impediment, dyslexia, selective mutism
What additional research is needed to help address co-occurring conditions for autistic people?	Genetic links to comorbidities (eg: Ehlers-Danlos Syndrome and Autism link)
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Equitable access to public transit, pictures at public offices/facilities for nonverbal communication, insurance coverage of adult autism testing/services
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Increased social anxiety and compulsions around germs
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Reduced social interactions and availability of services for adults, changes in routine

Name	Madeline Lodge
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The most significant challenges are sleep disturbances and sensory challenges. The autistic mind is always going at high speed and thus needs heavy sedation to fall asleep. In regards to sensory challenges, our senses are so fine-tuned that we are very selective with our food and drink (which means that we are choosy even when we are beggars) and we find bright lights overwhelming (like the ones in every public place ever)
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	When combined with autism, any benefits ADHD might have are nullified, and it just makes things worse. Anxiety is also common because of how the autistic mind thinks so quickly and the conditioning and paranoia many undiagnosed and allistic parents impose on their autistic children. Depression and suicidality in autistic people are NOT caused by the condition itself, but by the fact that it is one of the most oppressed groups in the United States. You see similar results among LGBT individuals.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	We need to find ways to manufacture ADHD medication cheaply and quickly so that everyone who needs medication can readily get it.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance coverage, accessibility and access to services, and lower lights and less sound in their areas to make autistic people more comfortable.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	The increased remote work and reduced in-person social interactions have benefitted autistic people greatly because they can now earn money in low light environments without interacting with other people who they cannot understand and who are very likely to be ableist towards them.

Name	Madison
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Sensory processing issues, sleep disturbances, stomach and bowel complications, co-occurring Ehlers-Danlos syndrome, co-occurring Postural Orthostatic Tachycardia Syndrome, panic attacks, autistic meltdowns, extreme periods from PMDD
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	ADHD, major depressive disorder, generalized anxiety disorder, PTSD, OCD, emotional regulation issues which lead to autistic meltdowns, self-harm issues, panic disorder, suicidality, self-harm, monthly meltdowns due to PMDD
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	I struggle to maintain relationships with others due to social struggles, I have a hard time keeping a job due to my constant overwhelm, I can't maintain a romantic relationship due to communication issues, I can't travel or participate in activities I would like to due to sensory issues
What additional research is needed to help address co-occurring conditions for autistic people?	There needs to be a deep dive into co-occurring issues for female autistics - in particular PMDD. There is a 92% comorbidity rate, but little to no information or support. I think research needs to be done to see how ovulation impacts those with autism. There also needs to be research on emotional regulation and how we can assist those who are constantly living outside of their threshold.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Easier access to therapists educated on autism, more resources for those with autism seeking to get an education, more support in the workplace for autistic adults, assistance with medical paperwork/insurance/logistics
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Isolation exacerbated my symptoms
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Being able to work from home has allowed more flexibility, and telehealth has helped me a lot as well to accommodate my sensory and travel issues.

Name	Maegan Hayes, Social Science Specialist
Demographic	Autistic individual; Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The significant troubles I suffer from are gastrointestinal issues. My ulcerative colitis becomes hard to manage when other aspects of my mental health are suffering, such as my depression and ADD.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	I believe the lack of representation when needed for advocacy. Yes the union is available, but a committee to support other neurodivergent individuals would be awesome. As often times, without this representation or knowledge of how to engage, individuals can leave feeling dismissed and misunderstood. Having a person with lived experiences would help create a safe place for individuals to feel included and heard.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The lack of representation to provide guidance through processes. As often times, repetition is the hallmark of understanding many difficult and confusing processes within the VA systems.
What additional research is needed to help address co-occurring conditions for autistic people?	Is there representation provided at every VA? Also, does every VA understand neurodivergent and co-occurring disorders? This is important, as often times the best employees are viewed as lazy or unmotivated.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Education of stigmas associated with autism and how to utilize support if colleague or participants are struggling.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Maeve Sherry, Pan-End-It!
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	Long Covid
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	self-injurious behavior
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	
What additional research is needed to help address co-occurring conditions for autistic people?	The link between autism and susceptibility to long covid and covid mortality
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Education for healthcare providers about how autism may present in different ages, genders, support needs levels, etc. Healthcare providers often perceive me as deceptive and I frequently experience discrimination in emergency medical settings because they profile me as someone who is "drug seeking."
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Long covid
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	Long covid

Name	mags, diagnosed autistic
Demographic	Autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	As I understand it, many autistic folks develop joint problems, namely a higher likelihood of ehlers-danlos syndrome.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	Medication resistance has led me to have Medication resistant depression. BH4 controls (among other things) for the porosity of the Blood Brain Barrier and many autistics have a BH4 deficiency I'm also disabled to the point I can't work and I'm on Medicaid and state insurance. There are treatments for depression that have shown to be effective in treating treatment resistant depression (ketamine therapy, transcranial magnetic stimulation to name a few) but my insurance won't cover them. They come out to thousands if not tens of thousands of dollars. Also included are a myriad of other health issues along the B4 pathway. I would refer you to the work of Kimberly Kitzerow's "Map of the Biochemical Biomechanics Behind Invisible Illnesses"
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	We experience a sensation of being on the other side of a window than the general public. We are manipulated more likely than our allistic peers and taken advantage of as well. the difference of being welcome in community and being treated like we're wanted there runs deep for us.
What additional research is needed to help address co-occurring conditions for autistic people?	Please read Kimberly Kitzerow's work. I'd stake my like on her work helping understand underlying facets of the Autistic condition.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	Insurance often won't cover treatment I need because the treatment is for my comorbidities, not directly my autism. That just isn't good enough.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	Nobody is the same as they've been before Quarantine. My CPTSD has evolved into something much more life-defining since quarantine. If I didn't have my 40-hour comhab support I couldn't function either in society or here alone.
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	I have close friends I haven't seen in years because of quarantine. My services are at times a nightmare to navigate, and moreover, people are less willing to be patient with autistic folks and I think it's because for the duration of quarantine nobody was patient with themselves.

Name	Maija Vance
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	The inability to attend school due to a nervous system disability called PDA. My son is unable to access school due to Pathological Demand Avoidance. This has caused our family to have to rearrange our lives including dropping my work so I can stay home with him. It also disturbs his sleep and can cause him to stay up all night.
What are the most significant challenges caused by co-occurring mental health conditions in autistic people? (Examples of mental health co-occurring conditions: depression, anxiety, attention-deficit hyperactivity disorder, aggressive or self-injurious behavior, suicidality)	PDA causes my son to feel different from his peers. He wishes he was able to attend school with his friends. He experiences anxiety and also ADHD. He has low self-esteem.
What are the most significant challenges caused by other conditions that co-occur with autism, such as learning disabilities, developmental disabilities, intellectual disabilities, and communication disabilities?	The inability to attend school and also to participate in a home school curriculum makes learning challenging for my son with PDA. He is behind his peers in school for this reason.
What additional research is needed to help address co-occurring conditions for autistic people?	More research is needed into PDA so that professionals and families can understand the root cause of the behaviors in PDA kids. Behavioral approaches actually cause more harm and led my kid into nervous system burnout.
What could be improved in autism services and supports to help address co-occurring conditions for autistic people? (Examples: Equitable access to and accessibility of services, insurance coverage, service systems issues, patient-provider interactions)	First off, just recognition of PDA as something real. And educating schools and healthcare providers of this profile in order to create interventions that actually help a PDA child and the family, such as much greater flexibility within a school regarding attendance. Once a child reaches burnout and can't attend school, and a parent has to stay home with them, support for the family during this time would be helpful. Insurance coverage for service dogs who could accompany a PDA child at school would be excellent. Financial assistance or home services for the family of a PDA child in burnout would help greatly.
What lasting impact has COVID-19 infection and illness had on co-occurring physical and/or mental health conditions for autistic people?	
What lasting positive or negative impacts have societal changes due to the COVID-19 pandemic had on physical or mental health for autistic people? (Examples of societal changes: disruptions in services, increased remote work and school, increased use of telehealth, reduced in-person social interactions and obligations)	

Name	Mara LaViola
Demographic	Family member of an autistic individual
What are the most significant challenges caused by co-occurring physical health conditions in autistic people? (Examples of co-occurring physical health conditions: gastrointestinal disorders, sleep disturbances, epilepsy, sensory and motor challenges)	I believe for many autistics the sensory issues are significant, global, and often overlooked. Much like Blindness and Deafness, autism is a sensory based disorder that is minimized, but the visual and auditory deficits that co-occur with autism are severely disregarded. Many autistics have visual and auditory impairments that make accessing the learning environment extraordinarily difficult and they need explicit and intentionally designed instruction in concept development, auditory listening skills and other items blind and deaf students get from the Expanded Core Curriculum. My son has cortical vision impairment and a functional loss of hearing that is so severe it is analogous to deafness. Both are functional losses of sight and hearing that are significant and woefully unidentified in individuals with autism. My son just got DeafBlind eligibility at the age of 19 because everything was attributed to his autism. I know you will hear more about the other physical health conditions so I wanted to emphasize these as they are severely underidentified and significant. In Europe, 40% of autistics also have cortical vision impairment.
